passenger side tail light on the side of the car. On BARRA Fords it is
on the drivers side of the boot.

Regards,
Sam

Sam thanks very much for the suggestions, of which I will certainly take up. Yeah a 9350 auto tune would be nice as would I think the 8558, in fact any autotune other than moonraker would a wonderful addition. Have been bidding unsuccessfully on ebay for ones which where previously on SAPOL cars here in South Oz. On my last reasonably long trip from Adelaide to Port Lincoln I did notice a fair amount of movement even on what appears to be smooth blacktop. SAPOL here use brakets which appear to be purpose built out of very thick plate which bracing underneath, however trying to find someone who knows anything about them, is like trying to find a cop when you you need one (no offence)!

Anyway thanks for the suggestions Sam.

Regards
Dave

Well Jim,
Most Toyota station wagons and the troopie's have bungs up on the
inside of the well behind the rear wheel wells,
i.e: where the jack holder is on one side at least. Just reach in and
feel along the lower panel that is to the INSIDE
of the well. (60, 80, 75,78 and 100 series Toyotas.)
Also on most troopies, wagons and Nissan patrols, there is also a
bung in the front passenger side
footwell, level with the start of the kick panel. I used this on the
latest Nissan ST we got for trialling, just couldn't
get through the firewall anywhere and Brissie was too cheap to buy a
rear spare tyre mount, Just like your work ones
Ben.
There you are Jim, you'll just have to climb under the vehicle to
see them easily near the chassis rail.
Regards,
Sam

OK Dave, I'll try and get a picture of one. A car was in today that is fitted with a stay, but
he is based 100 klm away so It will maybe just of the offset plate and the supprt stay, of
which I have one sitting on the shelf at the moment before I fit it to an Isa car.
If I get the photo, I'll upload it so everyone can see it, I'll put a ruller scale next to it.
Regards,
Sam

So the wiring has to go down from the rear auto tune on drivers side, under the vehicle and up through the jack holder panel ? Was also told there is a rear bung under the spare tyre (underneath) that often disappears and hence dust in the rear cargo part.
Yep, just going to have to find some flat ground and get underneath. Sick of the aerial sitting there not connected. Got every coax and auto tune lead under the sun at the front. Great for checking other peoples gear...:(((

Cheers
Jim

Well actually Jim, they are on both side, but you have to remove the
side trim on the drivers side to get
to that one. But seeing as how the cables supplied are designed to reach
from the rear of the vehicle to
the front, length shouldn't be a problem. Run it along the rear cross
member or actually through it as this
will prevent thrown stone damage to the cables.
There is also room to bring the cables in via the gap for the door
hinges and then through the bung for
the door cables.

2750. Stainless steel whip/9350??

What is the overall length & gauge of the 'optional' stainless steel whip for the 9350 ATU, and is it used with/without the spring mount. Thanks. VK2EZY/R364

2751. RE: [codan_outback_radio] Stainless steel whip/9350??

Not sure on the dimensions but it's very springy :) I suspect it's rough;y
the same length as the f/g whip. As far as I remember it just screws onto
the spring. This helps to dampen vibration and adds to the total length thus
giving a lower frequency limit.

Cheers
Jim

Ok info to hand.
The fibreglass whip is 1.58m high (excluding the spring), and the stainless

steel one is 1m, including the integral spring.

The short whip won't tune below 2.5MHz, and is around 2dB less efficient

than the long one.

Howz that ?

Cheers

Jim

2753. Stainless steel whip/9350??

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-05-14 09:30:55 UTC
From: Mick Barson
Topic: 2750 Message: 2753

I have had 3 SS whips,

1st was the original codan it was a heavy gauge 2-3mm I'd guess its all one piece and the wire is coiled around a nut which becomes the base, these are prone to snapping off at the bend. I dont recommend them. Would not tune into 2020

2nd was a very flexible SS whip from Bushcom, it ended up breaking where the wire protruded from the nut, not an easy fix unless you drill it out and weld in anew one. Would tune into 2020 if the large codan spring base was used. cost $50

3rd [and i have only had it a week] is from Terlin Outbacker and the SS whip is fitted into the nut and grub screwed so easy replacement is possible.
cost $45
I do not know if it will tune into 2020, i will try tomorrow, and I will have to get back to you on that and the length.

I dont use the spring mount.

HTH

The old model S/S whip was shorter than the Fibreglass whip, but the new ones are generally Longer.
Mind you they also come in varying lengths! The first batch we got, of which I have one, were
all made from 60" (Inch) S/S whip tops from antenna specialists in the USA with Aussie made base
swaged on. Later ones made frm the same whip tops but vary from 40" to 50" in length. The 60"
ones will work down to 2020 with no problems. These were all genuine CODAN replacement whips!

All are generally used without the big spring, but I leave mine on as it is easier to store the F/G whip
in the car without it! The new whips are very flexible to put it mildly!

Hi Guys

Essentialy you can put any whip on there.. What I have done is bought a 1/2 inch to 5/16 adaptor from the likes of dick smith (I have an 8558 which has the 1/2 inch thread) but these can easily be converted to a 20mm to 5/16 adaptor and then you can use any 5/16 antenna.

I have done this and use a $20 5/16 stainless steel whip which I bought from a comms shop, it has the grub screw so you can change out the element. I have on hand a super long bit of steel which I picked up from a scrap metal place which I can put in if I want to go a bit longer.

This is the ideal solution I see as 5/16 antennas are a dime a dozen (all 27Mhz and UHF CB antennas) and many could be modified or in the case of a 27Mhz used as is. I have had no problems with this system at all.

If anyone wants to know how to make an adaptor or have me make one for them let me know.

Ryan

The subject of whip adapters came up quite a while ago. See Mark's Photos in the photos section of the website to see what I have had made up.

Similar to Ryan, I have the 5/16 adapter for my 9530 and various stainless whips to suit. What I have been told is to be careful of some of the 27 mHz CB whips as they may not be rated to carry the full 100 watts from the Codan.

Cheers,

Mark

I just bought an 8528 from a fellow that got it surplus from the Canadian Government. Serial #B7442. The radio is has never been used It is eprom 4.30 and has the TXE option and selective call option.The 501 eprom memory channels are empty but I don't really care,I can program and overwrite the 99P channels at will from the front panel.I'm going to use the radio for amateur radio operation in my M151A2 military Jeep. So its Great that it has the TXE option.

I would like to add the lower sideband crystal,any recomendation on a source for the crystal? There are no Codan dealers that I know of here in the US.Also It didn't come with the mobile mount,so I'll be looking for one of those as well.

I hooked the rig up, stuck a 18 Mhz hamstick up on a tripod with a counterpoise and got good reports from friends in San Fansisco and Montana at 18157.50 Mhz, both about 1500 miles distance, the radio has very nice audio.Not many Codan Radios in this country but I'm sure happy with this one.

Cheers,
John Cook

Hi John, glad to hear the 28 is working well. Any xtal manufacturer will be able to supply the LSB xtal, and the install position can be seen on Bens Codan site.
We still have a few xtal manufacturers in Oz, but they aren't cheap. For the local market 1 xtal costs about $30AUD including normal post with a lead time of about two weeks.
Cheers
Jim

Thanks Jim,
I kind of knew that any crystal maker could make up the crystal for me.There are several types and sizes of crystal case, I'll need to know the casing type to order one. I guess I can just measure the distance between the holes in the board for the crystal, that should lead me to the case size and type.

I had a very good time operating the 8528 yesterday,all comments on the TX audio from friends I talked to were " sounds great"

Cheers,
John, K6ERO

2761. Umbilical cord for 8525R

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-05-18 23:27:05 UTC
From: coombesplo
Topic: 2761 Message: 2761

Missed out last week on a good deal on ebay for umbilical cord and coax etc so, asking around does anybody have a spare umbilical cord to suit an 8525A Remote Head that they may have for sale - obviously at a reasonable price - Jim I keep checking your site but nothing as yet on there.

My unit was previously with contained in an aluminium case so had the umbilical shortened quite considerably in order to fit in the case, I have extended it by the use of connectors to fit my vehicle (not sure if that is kosher - but still seems to work okay)but if only I had been quicker on ebay problem would be sorted.

I rang a Codan dealer to find out price of new one and you could have knocked me over with a feather they wanted over $200:00 for one - I asked them tongue in cheek if this included the radio!!!! As one would expect I didn't get much of a response!

The control head cable is pretty easy to make, just wire it straight through
(pin 1 to pin 1 etc)
be aware that the genuine cable has some pretty heavy duty conductors in it,
so purchase the cable accordingly. If you open up your original cable you
will see what i mean.
cheers

Jim,
The serial # is B7442 which I believe is the later model, am I correct?.... still learning much about this great Rig.Been making lots of good contacts with friends with it on the West coast of the USA, 1500 to 2000 miles away,on the 18 mhz band with just a hamstick whip antenna. My (not to accurate) average reading output watt meter is reading 50 watts so that means its putting out about 100 watts PEP.

Cheers,
John

2769. Considering a tapped whip

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-05-20 13:01:54 UTC
From: chrisnicholls2002
Topic: 2769 Message: 2769

Considering a tapped whip, in the face of pressure to move the 9350 auto-tune aerial from the front of the car to the back. Possible plan is to keep the 9350 on the back, which is sub-optimal, for daytime running on scan (to be available if a friend calls or sends me a selective beacon call) and use the tapped whip, mounted up front, for normal planned comms. Any comments?

Sources apart from terlin? (Need VKS freqs plus RFDS and RadTel would be nice but not essential.)

Does anyone have a spare spring base to suit?

Thanks

Chris

Can't the missus see properly ? :) You'll notice a huge difference in visibility when you shift the auto tune. I wouldn't of believed it, but I guess we get used to approximating where that side of the vehicle is.
I'm told that Ozwide uniform legislation on bullbar attachments etc is in the wind, so it's probably a good move. Any auto tune is better than none.
I'd be interested in the practical differences you find running that set-up.
Personally I don't expect to find enough of a problem with a rear auto tune to justify the vehicle looking like a porcupine (and twice as much to steal). Unless you plan on having a remote aerial change over relay it's going to become tiresome changing the plug in the back isn't it ?
The cheapest whip solution for 737 is the whips discussed in this forum recently, check the archives. There's another mob in opposition to Terlin in Adelaide, but I have never been able to contact them for prices. Perhaps they are only interested in dealers.
Good luck with it all.
Cheers
Jim

Hey Jim,
On the subject of Whipp antennae.Guess what arrived today from Isa!
Yes one of the 2 piece HF whips turned up lashed to the roof of our
workshop 100 series.
At least I should say "Lashed to the rear roofrack, center roofrack,
front roof rack and then to the
9350 out the front on the bullbar! Whip was dismantled at the time and
this was the lenght of the
2 pieces lashed side by side! I now see why he had difficulty putting it
in a vehicle to get it down to me!

I don't think I'll be able to send one down to easily you as it's bl***y
big.
It will be over 6 to 7 metres long when erected I think. But I haven't
screwed the 2 sections together yet
and I only managed to get it home still on the truck and it currently
goes from one end to the other in my carport.
Unit is marked "2 - 11 mhz" and is F/G with metal threaded join in the
middle and 3" diameter metal
mounting tube on the bottom.

Graham has a few more but we may have to work out a better delivery
system. Yes folks we are cheapskates
we don'y want to pay for frieght.

I'll get a photo this weekend, when I put it together. As a joke I told
the missus it was for her Daewoo
to go with the 6924 in the boot. Needless to say I am sitting on the
verandah, in the cold, writing this.

Regards,
Sam

When Codan tested the variation of 9350 between Front and Rear mounting, they didn't even bother having Tapped Whips in the comparison, because they are low in efficiency.

So if you put a whip at the front you will most probably find that the gain through position, is less than the loss due to aerial type.

If you already have a 9350 and you want an arrangement where you have a reasonable antenna you can use while travelling, and then a second arrangement for higher gain when stationary, I suggest these two options.

Put a very long whip on top of the 9350. I bought ex-army 1 metre Tank Whips and I can set up a 6 metre whip easily. They are 10mm at the base and the top two sections taper. This is good if you are trying to communicate long distances > 1000km.

If you want to contact people <300km away a vertical antenna is about teh worst choice. In this case you should attach a wire to the top of the 9350 and run it out horizontally.

The 9350 Autotuner can tune any whip/wire length, as long as it is less than a quarter wavelength. i.e. At 15 MHz less than 5 metres, at 10MHz less than 7 metres, 5MHz less than 15metres etc.

Mike

Hi Sam. I'd forgotten about them. Sounds vewwwy big, but I'm sure there's a way. I will think on it for a while.
I can see that your wife has a great sense of humour. But she might of at least sent you a Tim Tam to consume and a torch. Ah well, we don't really appreciate em till we face the prospect of losing em....thats when we learn not to make jokes :-)
I have a small number of Radphone 2000's coming. I was musing about a small phone interconnect service.
Then I thought allocation of frequencies hassles, expense and who'd use such a service anyway. Refugees from the other services who are on the eastern side of the country. Anyway I'm only thinking at this stage. Hey Sam you could put one in your backyard.:)

Thinking...who do I know with a semi that runs through the Isa. Melb to Bris, but noone comes to mind. Yet :-)

Anyway hope all is well. I remember how cold it can get up there, I remember 6C in Cairns one morning.
Cheers
Jim

Hey Jim,
On the subject of Whipp antennae.Guess what arrived today from Isa!
Yes one of the 2 piece HF whips turned up lashed to the roof of our workshop 100 series.
At least I should say "Lashed to the rear roofrack, center roofrack, front roof rack and then to the
9350 out the front on the bullbar! Whip was dismantled at the time and this was the lenght of the
2 pieces lashed side by side! I now see why he had difficulty putting it in a vehicle to get it down to me!

I don't think I'll be able to send one down to easily you as it's bl***y big.
It will be over 6 to 7 metres long when erected I think. But I haven't screwed the 2 sections together yet
and I only managed to get it home still on the truck and it currently goes from one end to the other in my carport.
Unit is marked "2 - 11 mhz" and is F/G with metal threaded join in the middle and 3" diameter metal

mounting tube on the bottom.

Graham has a few more but we may have to work out a better delivery system. Yes folks we are cheapskates
we don'y want to pay for frieght.

I'll get a photo this weekend, when I put it together. As a joke I told the missus it was for her Daewoo
to go with the 6924 in the boot. Needless to say I am sitting on the verandah, in the cold, writing this.

Regards,
Sam

John, K6ERO,

You have got in any way superb rig. Also have the same, integrated, using on ham bands (mostly on BPSK31 on 14.070 - dital mode) and it is doing great job. I have contacts with all parts of the world through simple Windom antenna. You can get HAM eprom , A option, from manufacturer (about 15 us $) so you can use all ham bands and frequencies with VFO. Change old with new one and that's all!

All about 8528 is on Ben's site - modifications, manuals etc. In fact, I was a bit suspicious at the first time about 8528 (never heard about it before), but what a mistake - I like it very very mucn now (my Yaesu FT107M, also great rig, is staying off for the time being). It is pro rig in everything.

Ok John, all the best with Codan, you will like it. Try digimodes - super thing!!!

Take care and 73's de Misha YZ1MW from Belgrade

2776. 8558 auto tune

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-05-21 04:27:14 UTC
From: skippylambchops
Topic: 2776 Message: 2776

Hi there just wondering if there is anyone in adelaide that can help me with my 8558 auto tune antenna. The problem I have problems tuning to 4, 11,and 14megs. We pulled it apart last night and cleaned the guts, it works more quite now, but still can't tune to these channels. I am running a codan 8528 radio inside a patrol, Sometimes when I do tune to a channel and talk it comes with a fail tune or not tuned signal and beeps at me. can these go out of tune while your talking or is it an internal problem. we did notice the copper inside the tube thingy was a bit worn ,could this be replaced or fixed .

Any sugestions please

:-)

Well I'm not in Adelaide...but I'll try. Did you ever have it running on those frequencies ? What frequencies does it tune to ? Are there any frequencies that you can use without it going out of tune ? Do you use it with an AD card or an 8551 controller ?
Cheers
Jim

Hi Skippy lamb chops,

I occasionally have had similar results. In regards to the 8558 no tuning , have you tried to change the internal link setting in the base of the 8558. There is information on Bens website on how to do thise, it takes about 5 Minutes to do. It solved the problems that I had with not being able to tune at around 7Mhz.

Regards

Paul

Mike (and others),

I have found a good solution if you want to quickly rig up a temporary (when stationary) longer vertical (or near horizontal) extension for the 9350. Buy a 'Giant Squid Pole' (made by Jarvis Walker and other fishing gear manufacturers - mine cost $29.95 a few years ago). It is a thin-walled telescopic fibreglass pole that is 1 m collapsed and 6.5 m long extended. Put 1 crocodile clip on each end of about 6m of wire, 1 to clip onto the top of the pole and the other to clip onto the top of the 9350 base. It is light weight and easy to carry.

You can mount it near horizontally if you want a NVIS effect.

I have used it very successfully as a 1/4 wave on 20 m if you bypass the 9350 but if you include it, you can tune all frequencies with a lot of signal out for low cost.

mike et al,

Codan make a handy-dandy NVIS kit for the 9350. Its a two piece f/g that screws together to make a 4 metre whip. Normally used with a 45 degree adapter that gives really good high angle takeoff. I don't see any reason not to use it on a rear mounted antenna as long as your not 'going bush' under trees etc. When stationary, I've removed the adapter and used it as a vertical whip. Great comms from southern Africa back to Europe! This was with a 9360, the overseas version of 9323.

Cheers

John

Hi Mike

Now this has me intrigued - over the years I had gained the impression that a tapped whip was more efficient than an auto-tune aerial - any opinions out there based on real experience and comparisons?

As to Codan's comparisons (I've seen the article discussing the relative merits of front bull-bar mount versus mounting at the rear), I would have thought that Codan would only compare (and promote) the products they sell. I'd assume thay would not publish any results that would send customers off to buy a tapped whip instead of an auto-tune! (Fair enough too, I suppose.)

I'll make up a custom mount for the spare wheel bracket on the Nissan, which will put the top of the plastic section of the 9350 about 30cm above the roof and about 600mm or so back (mounted rear of the spare). At that height the body of the 9350 is still protected by my roof rack/rooftop tent. Is it true that the top 30cm or so is a radiating element of the aerial?

Thanks to all for the other responses.

Chris

Chris, the effeciency of a tapped whip depends on many things but overall they are very ineffecient. The whip section is a major part of an autotunes radiating system.
Cheers
Jim

Now this has me intrigued - over the years I had gained the impression that a tapped whip was more efficient than an auto-tune aerial - any opinions out there based on real experience and comparisons?

As to Codan's comparisons (I've seen the article discussing the relative merits of front bull-bar mount versus mounting at the rear), I would have thought that Codan would only compare (and promote) the products they sell. I'd assume thay would not publish any results that would send customers off to buy a tapped whip instead of an auto-tune! (Fair enough too, I suppose.)

I'll make up a custom mount for the spare wheel bracket on the Nissan, which will put the top of the plastic section of the 9350 about 30cm above the roof and about 600mm or so back (mounted rear of the spare). At that height the body of the 9350 is still protected by my roof rack/rooftop tent. Is it true that the top 30cm or so is a radiating element of the aerial?

Thanks to all for the other responses.

Chris

Jim,

I am certainly no antenna expert but I am a bit puzzled by all this. First up, surely the radiating element is the whip for the auto ATU. As it is a very short (in terms of wavelength) random length of wire it can not be any more efficient than a resonant whip? After all, all the ATU does is try to overcome an impedance mismatch?

On the other hand, if a whip is resonant at a given frequency and presents a 50 ohm load (assuming the installation and artificial earth on the vehicle allows this) then it would surely be more efficient? In which case the tapped whip which, if properly designed, is resonant would outperform the auto tuned unit?

The exception might be when the ATU matches a long wire and the capture area is greater.

Help me understand why you think the opposite is the case. By the way, I am not denying your view that the tapped whip is inefficient, I just think that would apply even more to the little whip on top of the aATU.

Chris,

The top half of the auto-tune body has a variable coil. The antenna uses more or less inductance to cancel out the capacitive load presented by the short whip. As this is part of the antenna, it is a radiating element. In fact as the power of the antenna is greatest at the bottom, this is the reason for ensuring the top half of the antenna body is clear of metal obstructions.
Hope this helps.

John

2786. Re: Considering a tapped whip

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-05-21 21:36:52 UTC
From: Mike Richter
Topic: 2769 Message: 2786

Starting at the Transceiver connector, the Barrett, Codan, Moonraker Autotunes consist of
- an impedance matching transformer
- a vertical shaft
- a variable inductor
- a vertical whip or wire

So the top three bits form an antenna which is resonant at the frequency in use by varying the inductor. This is inherently efficient because all the current-carrying elements are able to radiate signal. If you mount it low near metal, then the lower parts don't radiate signal (e.g. below bonnet at front or below roof at rear).

Even for resonant antennas, if you make them physically shorter than a quarter wavelength, their impedance (resistive component) will still be well below 50 ohms, so the Autotunes use the impedance matching transformer to couple into it efficiently and to present a low SWR to the transceiver.

A tapped whip antenna consists of a vertical shaft (which shorts out the unused part of the whip) and coil. Because there is no signficant shaft above the coil this is referred to as top-loading and is inherently less inefficient as a radiator than the "centre" loading in an Autotune. Because they need more wire than a centre-loaded, because the coil diameter is small compared with its legth and because some of the coil is shorted out, it is less efficient electrically than a centre-loaded antenna.

When I measured the impedance of a tapped whip (Outbacker Survivor) at its lower frequencies, I was surprised at the high impedance (resistive component) of 40 ohms, since an ideal 2 metre high antenna loaded to be resonant at 5 MHz should have measured more like 4 ohms. I believe the reason is the inefficiences. Remember that a 50 ohm resistor presents great SWR at all frequencies - but that doesn't help it radiate well.

The benefits of a tapped whip are small size, making it easier to mount and carry inside the vehicle, compared with an autotune.

Topic: 2769 Message: 2787

Howard, without wishing to delve into too much theory, lets have a quick look. I said that it was more ineffecient for a number of reasons so lets have a look at a couple. Firstly the diameter of the wire. An autotune will use substantially thicker wire, and given the skin effect this will make a difference. Secondly, the diameter of the former. A whip is much thinner. These are just two differences. Not forgetting the radiation resistance of course, Mike :-)
In the real world, whip effeciency of some commercial whips is likely to be as poor as 20-30% .
Sorry I haven't got time to go further, I have a "power breakfast" to attend. (see if you have the power to get up:)

Cheers
Jim

Thanks to all for the explanations - a very interesting topic. From what I have read the Codan system is somewhat different to those used by SGC, etc, in their ATUs where the radiating element is totally external to the tuner. So I guess the danger is in considering them all in the same mould when looking at efficiency?

I think there are a lot of urban myths floating around on antennas and it is great to get some real information out on the effectiveness of the different solutions.

Howard, VK3DLH

Care to explain why a centre-loaded antenna is more efficient that a
top-loaded one? The bottom section does most of the radiating, and
on the top-loaded (tapped) whip that is the wander lead.

I'm glad I said "without getting into too much theory ...or words to that effect". Perhaps there's another angle. To buy a commercial whip aerial with 737, RFDS on it through a dealer would cost maybe $500 ? And should the allocated frequencies or my service network provider change then I may have to buy another whip. Ever change a tap in the wind and rain when its dark? I have. Ever needed to change channels in a duststorm? I have. Ever wanted to have a resonant aerial more than 100khz away from its tap on a lower frequency ? I have.
Now perhaps I'm lazy, but I'm hardly an ill informed autotune devotee :)

Cheers
Jim
PS..Yes I do have "issues" with the "tuitorial". Can anyone else see them ? It's not with what's written (which is technically correct) but with what's been left out :-)

Well I thought I would add to Jim's comments. Tapped whips are a pain in the rear end. Until I got an Auto tune antenna I used single frequency whips. Non tapered, top loaded. Al;ways worked well. Auto tune does not work quite as well but they always work at the desired frequency and you cam make them work from inside the vehicle when its hosing down with rain. Have used multi tap whips as well, funny how the only time you need to change the frequencies is when its raining. Must be a moral or lesson in that. Well that's my 2 cents worth :-)))

None of the above relates to being ill-informed. An autotune antenna
IS one helluva convenience, as I indicated. But the matter that was
being addressed was EFFICIENCY IIRC.

So true, and are you measuring forward or reflected power and where in the cable do you have the meter and how long is the cable from the meter to the set. So many questions, so many variables and so little time. Ho Hum :-))))

Topic: 2769 Message: 2797

I've got my gumboots (wellies to some of us:) on so I'll wade right on in.

I'm going to argue that it's all a bit academic.

Lets assume, for example, an aerial test range. With all the usual lab gear set-up etc. Let's also assume, for argument , that our instruments tell us that the whip is more "efficient" (and I'm assuming that we've agreed on this terms definition). Just how useful are our results ?

To find out, we have to ask some questions (again). Which whip and which auto tune at which frequencies ? Ok so lets test the range of available units." Ah ha" , you may say, reproducible scientific proof that A is more "efficient" than B. Agreed with some reservations.

But just how useful are these results ? Let's introduce a new word, "time". Had a look at the mounting of your whip lately ? Rust and corrosion perhaps ? Bit if dirt etc? So the radiation resistance has varied ? Hmm...now what about an auto tune. It suffers the same problems, yes ? Now doesn't the atu attempt to minimize any changes in order to find the lowest swr ? Does our whip do the same ?

But where are 80% of whips mounted ? Now, 80% of auto tunes ? Hey wait a minute. The auto tune whip is mounted on top of the atu. The whip is mounted on a support (bullbar). So the atu whip "pokes up" further, and hmm.....does this make a difference all the time at all angles of radiation, or only under certain conditions ? Or no difference at all ?.

Getting back to the tuit, to say that a well engineered whip is more efficient than an atu may be making some brave assumptions, some of which are revealed above.
Now my textbooks (yeah I know, old and out of date etc :) tell me that wire diameter and the dia. of the former will affect "efficiency"(along with a lot of other stuff). A decent Codan atu has wire that is "bigger" for its winding on a somewhat larger diameter than the average (Terlin ?) whip. Not only that, but the bit that supposedly does the most radiating is almost always mounted in an elevated position in comparison to the whip. So what does that tell us about our concerns with "efficiency" ?

We can argue theory until we turn blue. And I'm sure that what I've mentioned is only part of the story, perhaps a small part. In reality we choose to have an auto tune for a variety of reasons, very few of them having much to do with "efficiency". If they both work fine when we want them to, then what's the problem ?
Perhaps we're addressing the wrong question ? :-)

Cheers
Jim

Hi Jim I mainly use the VKS737 Channels, from
3995,5455,8022,11612,14977 megs. I used to tune to these channels
before, , the tuning stage takes longer to tune if i don't tune
regular. Now I can't tune anything over 9 megs. I would like to tune
upto 27/28 but I might have to get a 9350 antenna for that. All
I've got is the tuner on the control head what is the going price
for a second hand 9350. and will that be a better antenna for me.

What particular radio are we talking about ?
If you make a few selcalls etc the 8551 gets stroppy over time. The internal contacts get crud on them. You can pull it apart and fix this (but it may happen again). See http://ozradio.wireless.org.au/index.html for how to do it.
If you have an 8528, 8525B , 9323 or NGT then yes the 9350 is a much better aerial for you. Much more dependable and a super fast tune compared to the 8558 (3 seconds typical !). Depends who you buy them from. I will have some hopefully next month and will sell for around 750-775 (depends on freight costs for me to get them). They are around 1400 new.
Cheers
Jim

2804. RE: [codan_outback_radio] A hitch hikers guide to the tapped whip thread :)

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-05-22 13:52:29 UTC
From: Jim
Topic: 2769 Message: 2804

I'd better elucidate. "I had gained the impression that a tapped whip was more efficient than an auto-tune aerial - any opinions out there based on real experience and comparisons?"...CN

The question appears to be has anyone had any experience comparing these types of aerials in terms of efficiency?

I pointed out some of the problems faced in comparing these aerials. If we had a whip on the front/back and an auto tune on the front/back at the same time, and a constant local signal source, it may still be difficult to draw valid conclusions because of the variables involved.
Even swapping them using the same mounting point may not be definitive.

And so gaining valid "real experience and comparisons" may be a difficult thing to do. I'm sure it's not impossible, but it is difficult.

I think Mike had a nice explanation backed by some measurements. But did it completely answer the question that had been asked ?

Of course it's pretty easy to say "yeah well my whip has it all over my auto tune" or the other way around.(I was tempted to do just that) We're all entitled to our opinions. But the question asked for these opinions based on "real experience and comparisons".

So lets have a look at that question again. Why would anyone ask if one sort of aerial is "more efficient" than another ? Does not that imply that one kind of aerial is "better" than another ? (and isn't that how arguments are born?:) Better for what, and under what circumstances ? Yadda Yadda.

QED, the question is the *problem* -)

Cheers
Jim

While on the subject of tapped whips just thought I'd mention I purchased one of those FAMPARC whips. Talked to mobiles in Vic and Alice Springs Base on the VKS-737 network.

Question is "Would an ATU done any better?" (here we go again LOL)

More than happy with it for the price. Will install it on a hinged bracket in my Bushtracker caravan together with the other UHF and CDMA and car radio. They all fold away when mobile.

Oh for the simple life again.
Ernie

2806. Re: That tapped whip question!

Yahoo group: codan_outback_radio (1997 — 2004)

Wow! Thanks to all for the contributions. I'm learning lots.

As Jim said, the question was the problem. I'm always telling my bosses they need to carefully define the questions they are asking, and to be careful about applying previous answers to new questions. Same problem here.

The context for my question is the need to move the 9350 auto-tune aerial from the front of my car (Nissan Patrol wagon, top of bull-bar mount) to the back of the car. Now I've seen plenty of suggestions that it won't work as well mounted on the back. Mounted at the front of the car the radio/aerial has worked very well. I'm just back from three weeks in the bush (Simpson desert etc), logging with VKS most nights, and got some very good signal reports from operators, and also kept in touch with friends travelling in WA. Its been working really well and I don't want to lose the performance.

What I was wondering was whether I'd recover the same level of performance, while staying within the new legal guidelines (eg nothing thicker than 30mm diameter in driver's field of view), by using a tapped whip? I used the term "efficiency" which I see has special meaning to those who understand the theory, but maybe I really meant "effectiveness" - the ability to hear other stations and get out a signal they can hear. All compared to the original setup. And also - compared to the 9350 ATU mounted on the back of the car. Lots of variables there!

So - thanks again for the discussion. I've actually now moved the 9350 to the back of the car, mounted on a bracket I got from Terlin several years ago, that puts the mount just above the upper door hinge on the driver's side. The top 30cm of the aerial is above the roofline. I'll see how it goes. And I'll look into getting a longer whip (where do you get those ex-mil tank whips?) that puts more of the aerial above the roof, and also will try the trick of using a length of wire strung horizontally from the top of the ATU.

Cheers!

Chris

Wow! Thanks to all for the contributions. I'm learning lots.

Chris, a friend of mine has just raised another interesting point that we all appear to have overlooked. The Codan atu has an inbuilt wide band pre amp. Whips don't have them. Now if your whip tap is a long way from the frequency at which you are being called, there may be a call loss which might not of happened with the atu.
As many of us scan a range of frequencies, it may well be that we miss more calls on the whip.....

Cheers

hfpack is group of over 4000 worldwide who are interested in portable hf communications using power from 1 watt to 20 watt.
http://groups.yahoo.com/group/hfpack/

If you want to see what types of hf antennas put out the best signals, go to http://www.hfpack.com/ then click on Pedestrian Antenna Shootout reports. They perform these tests in realistic situations using accurate measurement to do the comparison.

These are not vehicle-mount antennas, but could be used on a vehicle.

Would this tell the whole story ? Surely the reason for measuring might be to suggest that aerial "A" is more suitable under certain conditions than aerial "B" ?

Would there be any point, I wonder, in reporting that "at a radiation angle of 45 degrees, my brand X whip with an swr of 1.1:1 provided 0.2 db of gain at 13997khz over my tuned brand Y auto tune under the same conditions".

The results would be interesting , but would they be useful ? Is there anything to suggest that the results might show a large enough numerical difference to make the exercise worthwhile ?

I still suspect that with auto tunes and whips we'd be comparing apples and oranges.

On the other hand, anyone got a spec analyser and a test range free for a couple of weeks ? :))

Cheers
Jim

How about this -

Given the same length / diameter / cost / mounting-postion / weight etc which antenna produces the best signal at the receiving site.

Codans comments on the difference between mounting the SAME aerial on the bullbar or the front bumper bar are -
"enough to make a difference between mediocre to marginal communications and no communications"

Codans comments on the difference between mounting the SAME aerial at the front or the rear -
"would reduce strong clear signals to below receiver AGC threshold, making them marginalyy workable at best. Existing mediocre signals would be rendered unworkable."

Mike

> The results would be interesting , but would they be useful ? Is there anything to suggest that the results might show a large enough numerical difference to make the exercise worthwhile ?

2814. RE: [codan_outback_radio] Re: Considering a tapped whip

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-05-23 03:58:03 UTC
From: Jim
Topic: 2769 Message: 2814

Must admit I'd read and forgot it. Couple of points.
I wonder why the study was done ? Obviously it was some sort of response to legislation but how much bias was there ? You can often find what you expect to find.
The test tx was 4km away, and the differences were most dramatic (front/rear) from 5-10meg. This should be of some concern. But 4km suggests ground wave at a fairly low angle of radiation ? Would typical mobile comms be using ground wave here ?

What we need to do I guess is a practical test with the same kinds of aerials at the front and rear at the same time. That way we could compare the same sigs using any radiation angle.

The great Codan Group aerial test field day. :-)

Cheers
Jim

I think you've all got it wrong.

What we should be testing is the same Codan auto tune antenna on different vehicles. Then we will know if a Nissan is a better 4WD than a Toyota, etc

<grin>

Howard, VK3DLH

Jim,
Ouch, don't you hate that. Info right under your nose and cant see it.

When I replaced my whip on the front with the 8558 on the rear a guy in Auckland on my 7.000 mHz frequency said my signal strength was weaker but audio clarity was greater. So does signal strength show everything????

Also, maybe I should have but didn't try turning the vehicle around and re-trying the antenna's as the radiating pattern would be different.

2822. RE: [radio] [codan_outback_radio] Digest Number 626

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-05-23 08:52:03 UTC
From: Alex
Topic: 2822 Message: 2822

Jim,

I'm not one for changing taps in the dark either and I've become a great believer in autotuners. The question of which is better, top center or bottom loading can be left to the budding engineers amongst us. I have learned in my 30 some years of radio that the thicker the radiator, the better the signal, so I've always shyed away from stainless whips. I've uploaded a photo of how I mounted the 8558 on my Jeep Wrangler. You'll note most of the tuner is below the metal line of the Jeep. However, a good 400mm of tuner, 1780mm of whip and spring stick up above the metal. The whip is homebrew, using copper braid from some old RG-213 on a hollow fibreglas form and covered with that wonderful Jaycar heatshrink.

The point is the 8558 tunes everywhere across the Ham bands, all the RFDS and 737 freqs. I don't have to get wet changing taps. BTW, I've logged 24 countries so far with my little 8558.

Cheers,

Alex VK1AC/2

Subject: RE: Re: Considering a tapped whip

I'm glad I said "without getting into too much theory ...or words to that effect". Perhaps there's another angle. To buy a commercial whip aerial with 737, RFDS on it through a dealer would cost maybe $500 ? And should the allocated frequencies or my service network provider change then I may have to buy another whip. Ever change a tap in the wind and rain when its dark? I have. Ever needed to change channels in a duststorm? I have. Ever wanted to have a resonant aerial more than 100khz away from its tap on a lower frequency ? I have.
Now perhaps I'm lazy, but I'm hardly an ill informed autotune devotee :)

Cheers
Jim

Alex, perhaps we need to invent a new term, "operational efficiency". That way you can argue
a) My auto tune is better than a whip or
b) My auto tune WORKS better than a whip. Or vica versa.

Jeep ? You highland trendite, you. :) Still you couldn't very well hob knob with the clientele down your way in just any old 4wd, could you ? :-)).....

Cheers
Jim

Subject: RE: [radio] [codan_outback_radio] Digest Number 626

Jim,

I'm not one for changing taps in the dark either and I've become a great believer in autotuners. The question of which is better, top center or bottom loading can be left to the budding engineers amongst us. I have learned in my 30 some years of radio that the thicker the radiator, the better the signal, so I've always shyed away from stainless whips. I've uploaded a photo of how I mounted the 8558 on my Jeep Wrangler. You'll note
most of the tuner is below the metal line of the Jeep. However, a good 400mm
of tuner, 1780mm of whip and spring stick up above the metal. The whip is homebrew, using copper braid from some old RG-213 on a hollow fibreglas form
and covered with that wonderful Jaycar heatshrink.

The point is the 8558 tunes everywhere across the Ham bands, all the RFDS and 737 freqs. I don't have to get wet changing taps. BTW, I've logged 24 countries so far with my little 8558.

Cheers,

Alex VK1AC/2

Subject: RE: Re: Considering a tapped whip

I'm glad I said "without getting into too much theory ...or words to that effect". Perhaps there's another angle. To buy a commercial whip aerial with
737, RFDS on it through a dealer would cost maybe $500 ? And should the allocated frequencies or my service network provider change then I may have
to buy another whip. Ever change a tap in the wind and rain when its dark? I
have. Ever needed to change channels in a duststorm? I have. Ever wanted to
have a resonant aerial more than 100khz away from its tap on a lower frequency ? I have.
Now perhaps I'm lazy, but I'm hardly an ill informed autotune devotee :)

Cheers
Jim

In regards to matching of the Tapped Whip.
One thing I can remember about tapped whips, and this dates back to the 60's and 70's and the
heady days of the "Wagner" HF family, at least in the NSW Gov. Ah the C1-25 the C1-100 and
the 1729, oh yes not to forget the P5.
Anyway enough side tracking.
With the Tapped whip antennae used (Which are still basically the same as what we use now.)
and the spring base mounted on the vehicle, not forgetting to check that the Yellow band or raised
ring on the lower part of the whip was mounted above any surrounding metal (AEA, Scalar and Wagner
whips.), you then layed out the 21' (Yes twenty-one foot! From shield connection on the antenna base
to the rear of the BNC/UHF connector on the tranceiver) of rg58 coaxial cable, complete with BNC
connector for the tranceiver, ensuring that any slack or spare cable was layed out in an alternate or
overlapping, but never on top of itself, "S" format and never coiled or cut to exact length.
In other words the coax cable was considerd part of the matching network for the tapped whip.
At least thats what all the paperwork used to say, and by laying it out in "S's" you prvented the cable
from becoming an inductor or "Rubber Mat Melter" which is what used to happen if you tied it into
a nice coil and put it under the floor mat!

Some food for thought, I ahven't seen any instructions from a whip supplier for years mentioning the
length of coax between antenna and tranceiver when fitted to a mobile. Oh yes this was only done when
it was fitted into a vehicle, the reason given, "Because of the poor "Couterpoise" or groundplane encountered
when fitting an HF SSB radio system to an automobile or light truck, these instructions must be followed to
prevent damage to equipment and vehicle!" This was all before computerised engine control systems etc. in
cars too!

Regards,
Sam

Sorry for being slow Jim. At least I entered the fray, no one else
thought about hte RG 58 with the Tapped Whips
did they?

One of those weekends. Getting ready for a flying trip (Plane.) to
the In laws down South and my cousins for an
engagement party so tidying up the grounds, but it's raining so no
mowing or antenna raising. Got to get the longwire
and the new vertical up sooner or later. I have an old (well brand new
in the box!) RACAL HF 16 channel antenna
tuner unit that I want to put on that vertical radiator as an emergency
backup to the longwire. Should be fun.

Yep, I might even bring back more of my manuals and bits! 20 kg of
luggage times 4 people of which only one
bag needs to hold clothes for trip. Mmm, wife says "Wedding photo's and
Slver service must come back." well thats
only 6 kgs.
The possibilities. Theres still a P5 with the brother in law etc.

It wasn't a seperate matching stub, even though have used used one. It
was the run between the base and radio.
Oh yeah, we're 20 odd k from the nearest mangrove and the mossies need
jumpers out here at night!

You should drive down and take a trailer...for the Codan and vertical to go along :) Mozzies up there are ok until you see the yellow legs and they're eating you in the daytime. Mind you they're down this way too. We breed our own also :(

80k limit. But you have to carry it all. Don't think the kids would be happy to have their bags full of manuals and bits. Even telling em its all my fault probably wouldnt do any good.

I'm in a valley which isn't the best for radio, and the sun gets up kinda late here. Sleep in and ya miss it. Still everyone says its beautiful. Better than looking at a brick wall. Gets out better also.

Cheers
Jim

Topic: 2769 Message: 2831

Hi Sam,
Wondered when someone would bring the cut coax length into the discussion. When I was installing Radio telephones into vehicles I always used to cut the coax in multiples of 1/2 a wave length and always ensured that the cable was not cut in odd multiples of 1/4 wave lengths.
Apart from matching questions the main reason for cutting the cable in 1/2 wavelengths was so that when the antenna was tuned we could measure the stainless whip and record the length. Then if the operator rang from the middle of know where we could measure a new whip, attach it to the fibreglass section (if a 5/8 wave antenna) and send it of knowing that when it arrived it would be tuned. This also applied to 1/4 wave whips. This would then apply to all the vehicles in the fleet as they were all cut in multiples of 1/2 wavelength and operating on the same frequency, therefore the antennas were all the same length. If the cable was cut to any old length every vehicle antenna would always need to be tuned individually if replaced. Also, for the 50 ohm matching of the cable to the antenna it is important to make sure there are no odd 1/4 wavelengths which would act as stubs.

Now I know that someone is going to come back and tell me this is all crap. I used to belong to the NZ 4WD Yahoo's chat group and would answer questions about CB installs. It must be noted that CB and PRS installs are about as far advanced in comms as the average 4WDer in NZ has got so far. I tried to make the point that, with needing to be tuned antenna's, if the cable was cut to half wavelengths, when an antenna was installed and the overall length measured, an antenna could then be supplied to any CB operator already pre tuned.
Ummm, HF whips, whether multi tapped or single frequency, must also fall into this category. The only unknown is, do the manufacturers use multiples of 1/2 wave lengths of coax on their tuning beds for the antenna's??? One thing I can assure you, even with auto tune antennas, is that if you cut the cable at different lengths the antenna will tune to a different position, if only a small amount. Hence the length of the coax must also effect the tuning of the antenna.
I have found that positioning the antenna on different places on the vehicle with 1/2 wavelengths only effects the radiation pattern of the antenna and not the tuning of the antenna. This IS NOT the case if the cable is cut to any old length for convenience.

I stopped voicing my experiences because there was always some smart guy who would come back and tell me I was wrong and here is the web page to go and read about it.
The above are based on my experiences of about 25 years of RT and HF installs. If you don't agree too bad, I will continue to cut my cable in 1/2 wavelengths and get consistent results anyway.

For those who doubt the effect of coax length, cut a quarter-wavelength coax, connect one end to the aerial base and leave the far end open circuit. For those who think in DC terms, this should have absolutely no effect - so how do they explain that any received signals at that frequency have totally disappeared ? This method is regularly used to filter out annoying frequencies.

A quarter-wavelength coax (or odd multiple) transforms the impedance to its "opposite" (complex conjugate) i.e an open-circuit becomes a short circuit, 25 ohms becomes 100 ohms (for 50 ohm coax).

If you are going to try this, remember that the wavelength in coax is 1.5 times that in free space (which has an impedance of 377 ohm). So if the wavelenth is 5 metres, a half-wavelength coax would be 3.3 metres.

So why did people doubt the importance of feeding antennas with a half-wavelength - I suspect they were confusing theory with the real world. If I connect a 50 ohm resistor to the end of a 50 ohm coax then it will appear as 50 ohms, no matter how long the coax. Aerials and transmitters are designed to have 50 ohm impedance, but they rarely are. Say your real aerials were 30 ohms and transmitters worked better at 30 ohms than 75 ohms. If you connect a 30 ohm antenna via a half-wavelength it will be 30 ohms at the transmitter. Now connect 30 ohms using a quarter-wavelength coax (or odd multiple) and the transmitter sees 75 ohms and is most unhappy !

> Apart from matching questions the main reason for cutting the cable in 1/2 wavelengths was so that when the antenna was tuned we could measure the stainless whip and record the length. Then if the operator rang from the middle of know where we could measure a new whip, attach it to the fibreglass section (if a 5/8 wave antenna) and send it of knowing that when it arrived it would be tuned. This also applied to 1/4 wave whips. This would then apply to all the vehicles in the fleet as they were all cut in multiples of 1/2 wavelength and operating on the same frequency, therefore the antennas were all the

same length. If the cable was cut to any old length every vehicle antenna would always need to be tuned individually if replaced. Also, for the 50 ohm matching of the cable to the antenna it is important to make sure there are no odd 1/4 wavelengths which would act as stubs.
>
> Now I know that someone is going to come back and tell me this is all crap. I used to belong to the NZ 4WD Yahoo's chat group and would answer questions about CB installs. It must be noted that CB and PRS installs are about as far advanced in comms as the average 4WDer in NZ has got so far. I tried to make the point that, with needing to be tuned antenna's, if the cable was cut to half wavelengths, when an antenna was installed and the overall length measured, an antenna could then be supplied to any CB operator already pre tuned.
> Ummm, HF whips, whether multi tapped or single frequency, must also fall into this category. The only unknown is, do the manufacturers use multiples of 1/2 wave lengths of coax on their tuning beds for the antenna's??? One thing I can assure you, even with auto tune antennas, is that if you cut the cable at different lengths the antenna will tune to a different position, if only a small amount. Hence the length of the coax must also effect the tuning of the antenna.
> I have found that positioning the antenna on different places on the vehicle with 1/2 wavelengths only effects the radiation pattern of the antenna and not the tuning of the antenna. This IS NOT the case if the cable is cut to any old length for convenience.
>
> I stopped voicing my experiences because there was always some smart guy who would come back and tell me I was wrong and here is the web page to go and read about it.
> The above are based on my experiences of about 25 years of RT and HF installs. If you don't agree too bad, I will continue to cut my cable in 1/2 wavelengths and get consistent results anyway.

Well, I suppose it does boil down to "operational efficiency". I like the idea of being able to sit in the parking lot of Department of Finance in Canberra and chat to a bloke in Scotland for an hour or so.

As for the Jeep.. Yes, well.. it was difficult to find a 4x4 that would readily take my Minimi mount.

;-)

Cheers,

Alex

Alex, perhaps we need to invent a new term, "operational efficiency". That way you can argue
a) My auto tune is better than a whip or
b) My auto tune WORKS better than a whip. Or vica versa.

Jeep ? You highland trendite, you. :) Still you couldn't very well hob knob with the clientele down your way in just any old 4wd, could you ?
:-))).....

Cheers
Jim

Hi Mike,
Thanks for the reply and agreement. I suspect that what has also happened over the years that as we have moved to higher frequencies, with the 1/2 wavelength getting shorter and shorter the likelihood of running out a length of coax and hitting a 1/4 wavelength has got less and less. Repeaters and services have got better and better and the need to have your radio work 100% all the time has also got less and less. Bad habits get passed on from one tech to another. Therefore we become more and more complacent and forget the laws of old. Hmmm sounds like a Moses problem :-)))

Can anyone confirm for me if the 85 on a Codan 8525 is indicative of its year of manufacture. Someone asked me the other day how old my readio was and I didn't know. But if the 85 indicates the year of manufacture it looks very good for its age....just like its owner!!!!

Alex,

When you get the time, I was wondering whether you would be prepared to post some information on how you put together the whip you refer to that is attached to the top of your 8558.

I too would like to make my own when I get the chance and know the best places to acquire the correct parts.

Cheers,

Mark

2843. Re: [codan_outback_radio] Coax length

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-05-24 12:41:15 UTC
From: Sam Point
Topic: 2769 Message: 2843

From memory Mike, AEA (Antenna Engineering Australia) used to rate the HF tapped whip
as around 23 to 25 ohms at the antenna base and this was the reason for the 21' of cable.
Also when I worked for HUBER + SUHNER (Swiss based RF connector and cable manufacturer.)
good quality, to ISO standards, RG 58 and 213/214 cable was worked out to operate at a coefficient
velocity of 66% the speed of light. It would vary from manufacturer to manufacturer and also depended
on the materials used for construction of the cable.
I still have a couple of the "Slide Rule" calculators we used to use to work out cable harnesses and runs
of cable to give us the equivelent 1/4 and 1/2 wave lengths in coax compared to "Free Space" 1/4 and 1/2
wave lengths. Very handy sometimes.
I also remember carrying around short "Jumpers" of RG 58 (Upto 18 inches (1/8 wavelength.)) with
male and female BNC connectors to extend cables when updating an Parks and Wildlife service to new
VHF Midband 12.5 khz channels. This was because early on in the fleet update some radios after being
changed over, failed to receive any signals on the operating channel but showed excellent "SWR", barely
twigged the needle, but when the radio was put into our service vehicle or another vehicle it worked perfectly.
This was of course caused by the RF cable in the vehicle working out to multiple 1/2 wavelengths and therefore
not passing the signal!

Regards,
Sam

From: Mike Richter
Topic: 2844 Message: 2844

If you are interested in selecting antennas, building your own antenna, setting up antennas or just understanding the way HF antennas work, there's plenty of reading for you now.

I've added a folder "Aerial Design" in the FILES section here.

It's not all theory - "HF vert ant comparo" shows the results of scientific comparison of field strength. The best antennas are all centre-loaded.

These articles also help explain why HF antenna design and construction is still considered more of an art than a science.

Topic: 2845 Message: 2845

Not a problem Mark,

As my original prototype blanks came from the Fleur Radiotelescope installation at Bagery's Creek, the first place you want to visit is Pacific Composites where they make hollow fibreglas fishing rod blanks... In fact you can get as exotic as you want with carbon fibre or the like.. Here's a link to their tubing catalog.

http://www.pacomp.com.au/adobe/prepreg.pdf

That said, you need a tapered blank with a large end diameter of at least 15 to 16mm to accept the folded braid and the appropriate 1/2 inch stud. (I'm assuming a Codan 8558 tuner with a 1/2 inch threaded insert.)

I measured out about 1650mm of form blank, stripped the outer braid from a longer length of RG-213 and stretched it over the form, leaving around 60 to 75mm to stuff into the larger end of the blank.
I trimmed the far end of the braid flush with the end of the form.

The assembly was then covered with heat shrink tubing from Jaycar and the end capped with a small vinyl cap and a dab of epoxy.

You want the assembly to accept the 1/2 stud tightly by screwing it into the folded braid end. Apply a good coat of two-part epoxy on the last few threads to be screwed into the form and be sure to leave enough thread showing to screw into the tuner or base mount. This makes your contact from the stud to the braid.

In my final prototype, I used the ferrule from a PL-259 connector screwed onto the outside of the assembly to keep the fibreglas from splitting under tension.

A liberal coat of two-part epoxy keeps all the bits together. You'll see where you need to put more or less.

That's all there is to it.. Slap it on the 8558 and hit the tune button. If you use the medium tension spring mount, the whip will bend nicely so you can clip it to the gutter mount when not in use. Nice when you don't want to remove the whip to get the 4x4 in the garage or under the carport.

I've had my whip in service for about a year now with no ill effects except the heat shrink fading a bit. In retrospect, I would have looked around for some UV stabilised heak shrink but the colour isn't really important to me...

Hope this helps you out,

Cheers,

Alex VK1AC

Alex the whip is probably the most abused part of the radio system. It gets whacked on a lot of stuff. Unless it's a steel one, the braid can get water into it and it will literally disintergrate over a period of time. I'd suggest that if going bush a lot, that the braid be covered by two lengths of heatshrink or use a piece of heatshink with the internal glue. This will make it heavier but it should last longer.
If you have a f/g whip, it's a good idea to check its resistance once in a while. If it's around 10 ohms or over, it's time to remanufacture.

Cheers
Jim

While on the subject Its good to bring back up some of that old radio theory.
But I'll be buggered if I could fit enough coax in the car for a 1/2 wave at 3995Mhz or 5455Mhz without coiling it. While the 1/2 wave length multiples may be a good idea for U/VHF and the higher end of H.F.. I would suggest there not practical for multifreq H.F. use. For now ill stick with my tapped whip.

Good point, probably also explains why no two engineers seem to agree when it comes to aerials. As a funny aside, I was once called into an establishment by the head tech who whipped out a set of drawings of a new aerial. He told me that an engineer had designed and installed it at the facility, and that he didnt think it would work. What did I think ? I hmmed and ahhd and nodded wisely. Obviously it would never work I agreed. (the engineer was 100k away so I figured he couldn't argue with me)

The problem was that the aerial was working and working well. The tech kinda forgot that bit. Talk about a red face. Ah duh Jim.

Cheers
Jim

These articles also help explain why HF antenna design and construction is still considered more of an art than a science.

From: boomaroo3007
Topic: 2851 Message: 2851

What is the thread/size of the threading at the top of the 9350 (ie where the whip base spring screws on).It appears not to be the usual 1/2" for most adaptors??
Would anyone in Codanland have a light duty spring base- suitable for a s/steel whip- that is superfulous to their needs???
If so, please contact me at op.support@...
Thanx

There is not a correct length, make the cable as short as possible
to reduce attenuation, the "autotune" antenna provieds a nominal
impeadance match to the transmitter and there is no need to provied a
coax length match.

Regards

Hi Ian,

Suspect you may not have read all the earlier posts. I'll direct you to mine as below. The relevant part is in italics

and further to your comments.

There is not a correct length, make the cable as short as possible
to reduce attenuation,
Don't agree with the above totally because, even with an auto tune, if a random length was cut off and it was a 1/4 wavelength, then the auto tune wouldn't like it either
Besides, what attenuation?????, whatever the cable length in a vehicle is the transmitter is not even going to see it anyway.

Hi Sam,
Wondered when someone would bring the cut coax length into the discussion. When I was installing Radio telephones into vehicles I always used to cut the coax in multiples of 1/2 a wave length and always ensured that the cable was not cut in odd multiples of 1/4 wave lengths.
Apart from matching questions the main reason for cutting the cable in 1/2 wavelengths was so that when the antenna was tuned we could measure the stainless whip and record the length. Then if the operator rang from the middle of know where we could measure a new whip, attach it to the fibreglass section (if a 5/8 wave antenna) and send it of knowing that when it arrived it would be tuned. This also applied to 1/4 wave whips. This would then apply to all the vehicles in the fleet as they were all cut in multiples of 1/2 wavelength and operating on the same frequency, therefore the antennas were all the same length. If the cable was cut to any old length every vehicle antenna would always need to be tuned individually if replaced. Also, for the 50 ohm matching of the cable to the antenna it is important to make sure there are no odd 1/4 wavelengths which would act as stubs.

Now I know that someone is going to come back and tell me this is all crap. I used to belong to the NZ 4WD Yahoo's chat group and would answer questions about CB installs. It must be noted that CB and PRS installs are about as far advanced in comms as the average 4WDer in NZ has got so far. I tried to make the point that, with needing to be tuned antenna's, if the cable was cut to half wavelengths, when an antenna was installed and the overall length measured, an antenna could then be supplied to any CB operator already pre tuned.
Ummm, HF whips, whether multi tapped or single frequency, must also fall into this category. The only unknown is, do the manufacturers use multiples of 1/2 wave lengths of coax on their tuning beds for the antenna's??? One thing I can assure you, even with auto tune antennas, is that if you cut the cable at different lengths the antenna will tune to a different position, if only a small amount. Hence the length of the coax must also effect the tuning of the antenna.
I have found that positioning the antenna on different places on the vehicle with 1/2 wavelengths only effects the radiation pattern of the antenna and not the tuning of the

antenna. This IS NOT the case if the cable is cut to any old length for convenience.

I stopped voicing my experiences because there was always some smart guy who would come back and tell me I was wrong and here is the web page to go and read about it.
The above are based on my experiences of about 25 years of RT and HF installs. If you don't agree too bad, I will continue to cut my cable in 1/2 wavelengths and get consistent results anyway.

Malcolm Langley

Timely question. I just bought a whip from Mobile-one (their M6-1, 1500mm braid over fibreglas) with 5/16 thread, and 5/16 to 1/2 inch adapter. But the adapter doesn't fit the 9350! I'd seen it referred to as 1/2 inch BSW. Tomorrow I'll take the spring out and buy a tap for that thread, and see if I can make up my own adapter. When I have the tap I'll let you know the size.

Chris et al.

The Codan 9350 Antenna uses an M14 metric thread, it actually states
that on the top of the
main tuner unit! Look at the surround insert of the thread sticking up,
it is there for all to see in plain
english, nothing hard intended and not a flame, just being observant.

G'day Brian, depends a fair bit on which way the wind is blowing, but you should get 7-900 for the 28 and around 3-4 for the 8558. Thats assuming that it is in good nick, has the right freq in it, all cables and brackets etc etc
Those are recent ebay prices, which are usually a bit lower than other markets.
Cheers
Jim

Hi Ian,
No prob really, at the end of the day with an auto tune, as long as its not a 1/4 wave it doesn't really matter.
Problem is that at 2 mHz 1/2 wavelength is about 50 meters and at 30 mHz its about 3.3 mtrs, makes it really difficult to get an ideal 1/2 wavelength because, no doubt in there somewhere is 1/4 wavelength of another frequency :-)))

<snippo>
PS: Since I receive this forum in digest mode normally, if people
could cut the unnecessary bits from their replies it would be REALLY
good.

Good point Ian. I receive several groups digests and it's both time
consuming and annoying to have to wade through tons of stuff to get to
the
message.
I'm as guilty as anyone else, so I'm going to try and do the right
thing,
and ask that others try and do the same.

Cheers
Jim

So, if it's still important to stay away from 1/4 wavelengths, then do some numbers on the VKS freq's (3995, 5455, 8022, 11612, 14977). Work out the 1/2's and [odd] 1/4's for those and you'll see a possible issue if you're not paying attention. Oh, and you still have to end with a useful length of coax to install.

Yep - it's also on the collar at the base of the spring. My mobile-one adapter (RAS) has now been drilled out and tapped to M14 x 2.0, and is safely installed atop the 935 with the new whip. Haven't tried it yet, but earlier today I did manage a short chat with friends on the Canning Stock Route, from here in Canberra, with the Bushcomm SS whip in place. And that's after moving the ATU to the rear of the vehicle. So I guess, for all practical purposes, it's still working ok.

2875. Aerial design

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-05-27 22:48:26 UTC
From: coombesplo
Topic: 2875 Message: 2875

I am new to all matters of HF radio so excuse my quite obvious ignorance. I run a Codan 8525A with remote head married up to a Terlin 1.2 metre whip with all VKS and RFDS frequencies.
I saw a posting the other day in relation to aerial design and was referred to the files section of this group. I belive I have what is referred to as a base loaded antenna (ie whip mounted on a spring with the coil in the base - that was something I learnt a coil exist in that big piece of metal below the spring!) - please feel free to correct me.

My aerial is mounted at the rear of my vehicle as i have a normal sedan (see pics in Photos under Dave's setup) and I was required to run two braided copper wires from the base of the spring mount to the body of vehicle. Now the article talks about ensuring the coil is mounted as far away as possible from the vehicle body to prevent what I believe is essentially signal loss. So that being the case whay would you mount two braided copper wires to run directly from the base of the coil to the body work of the car, surely this would result in the effect of connecting the two two parts coil and bodywork, together thus exentuating the signal loss.

Or have I just lost the plot? My understanding from reading these articles, and I note they are from the good ol US of A, is that the higher the aerial the better (so I am assuming that the 1.2 metre Terlin is next to useless and should be somewhere around 2.2 metre and boy couldn't you do some damage with that!!) the closer the coil or mounting base of the aerial to the bodywork of the vehicle impacts significantly upon signal. So if anybody can direct me to somewhere where all this is explained in plain english for the layman I would greatly appreciate it.

2876. RE: [codan_outback_radio] Aerial design

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-05-27 23:03:41 UTC
From: Jim
Topic: 2875 Message: 2876

<SNIPPO>

1. Dave you don't have a base loaded aerial. The Terlin is a continuously wound coil.
2 The spring forms a very small amount of the aerial. Yes it has turns, 4 or 5 out of hundreds.
3 In your case placement of the whole of the aerial is important rather than mainly the base
4 The car body essentially forms the other half of the aerial which is why bonding is so important.
5 Getting the whip higher may improve operation but practicalities determine mounting position with any mobile
6 As I have posted before, don't let all the techno babble worry you. If it ain't broke don't try and fix it.

Cheers
Jim

2877. Re: Aerial design

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-05-28 00:37:51 UTC
From: coombesplo
Topic: 2875 Message: 2877

Cheers for that Jim, after reading the info posted in the files section I was beginning to think I would end up driving around with a cr that looked like a porcupine with more aerials than telstras mobile phone service!

I have been reading also the posts on wavelenghts and gave up long ago! The theory which you espouse is to keep the coax as short as possible hence I am going to relocate the electronics box to the boot resulting in a reduction in coax length from five metres to approximately one and a half.

2878. Re: [codan_outback_radio] Aerial design

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-05-28 00:59:27 UTC
From: Cedric Woods
Topic: 2875 Message: 2878

Hi
Jim's comment in para 2 needs to be expanded.

If the correct spring is used there are no effective electrical turns in the spring due to a shorting strap.
Thus electrically the spring only extends the height/inductance of the whip by it's physical length and
it's equivalent inductance. This is not significant at low frequencies. It may become an issue at higher frequencies.

If the correct spring is used there are no effective electrical turns in the
spring due to a shorting strap.
Thus electrically the spring only extends the height/inductance of the whip
by it's physical length and
it's equivalent inductance. This is not significant at low frequencies. It may become an issue at higher frequencies.

vk6cd

Yep, and perhaps the closest and largest bit to the car, and I'd expect a small capacative effect with this particular installation.
However it's nothing for the average non tech owner to be worried about.
Moving the electronics towards the back of the vehicle won't bring any real benefit in electrical terms. The losses in the feedline will be negligable with that amount of cable anyway.
Main bit is to make sure that the aerial and control cables are kept apart otherwise they can interfere with each other.
Cheers
Jim

To get another head you may or may not be lucky. I've paid $150 for a good one with selcall etc.Its not uncommon to find that the membrane has broken down/been punctured and thats why they flog it off.
I've bought the 25B boxes from 200-300 as a stand alone unit.
Cheers

Of course another option is to try connecting to a 1/4 wave wire aerial.
(easy to make and throw up even in the bush). Switch between the two and see
if the rx is still deaf .
Cheers
Jim

2891. Tuning Antenna

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-06-07 00:49:11 UTC
From: coombesplo
Topic: 2891 Message: 2891

My apologies for interupting the previous post, but can someone tell me if I take a radio and tap antenna and mount it on another vehicle, do I have to have any sort of tuning done for the antenna, I think its called checking the SWER??????? If so can anyone recommend somebody in Adelaide?

2892. RE: [codan_outback_radio] Tuning Antenna

Date: 2004-06-07 00:59:25 UTC
From: Jim
Topic: 2891 Message: 2892

Yep, you sure can. There are some "rules" for doing it (of course !).
1. Make sure that the power comes from as close to the battery as possible
and use a very heavy gauge wire.
2. Make sure the radio has a decent earth
3 If its a remote head radio, run the aerial and control cables apart
4 Mount the aerial base directly to metal. ie scrape paint/rust on mounting
off
5 Mount aerial away from as much as possible
6 Make sure that the aerial base mount is earthed back to the chassis/body
of the vehicle
7 If you follow the above the standing wave ratio (SWR) should be acceptable
but have it checked anyway.
8 Sit back and admire your new installation.

Cheers
Jim.

Hi Brian,
For technical reasons it would not be a good for the radio's audio amplifiers to be connected to a common speaker. Only simple circuitry available is a speaker for each radio.

Brian

I had toyed with the idea of combining all audio into one speaker but it doesn't work too well - you're listening to one critical message and another blares over the top of it, but you are not sure which one it was, so you turn it down quickly enough.

What I am working on takes advantage of the brain's ability to dicrinate sound from different directions (The scientific term is the "Cocktail Party Effect" - not kidding).

I am working on mounting four small speakers around the headrest. For HF, Scanner, Phone and GPS. Two high, two low. Two left, two right. Having them close to your ears, compared with floor or dash mounting improves intelligibility as well. The sound level can be much lower so less annoying to passengers.

Because no mixing / interconnecting is required it is also tecnically simple. I will be using amplified walkman speakers.

I do something similar with my ham mobile speaker and my codan mobile speaker both tucked inside and beside the head rest - much to my wife's delight as I can turn them both really low in volume so as not to drive her to distraction! Each speaker is only a few inches from my head,

Hi Jim,
Gee, I would have thought that with your innovative mind that you would
have pulled it apart and found something else that would do the job :-))))

I have a sick loudspeaker in an 8525A that needs replacing asap. Anyone
happen to know if these are common garden variety ie availiable
somewhere,
or do I have to throw the head :((
Cheers
Jim

Remote or local type?
remote look for a plastic cone 50mm diamater 8 ohm
local i recall its about a 100x75mm or there abouts in size

try jaycar oe altronics they have a better range than dicky's

regards

Hi Jim,

Try http://www.wescomponents.com/

They are in Sydney but do alot of post orders. If they do not have it
then you could try http://www.farnell.com/

Also please email me you address for the book return.

Cheers
Wayne

2922. RE: [codan_outback_radio] Mr Speaker

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-06-09 21:49:58 UTC
From: Jim
Topic: 2904 Message: 2922

Was just wondering whether to do the extra "power" mods to the hire radios....I dont think so. While they're working .....must admit the term nf got me. How long since you asked for a 33 nanofarad cap? Being brain dead at that time of night didnt help. I should of left it till today. Or maybe not, son rang at 6am . He was over at the new g/f's place and his car wouldnt start. Could I get up, drive 20k and take him to work ? I always was a sucker !

2924. Re: [codan_outback_radio] Mr Speaker

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-06-09 22:09:02 UTC
From: Malcolm at "On- Track 4WD" in Greymouth
Topic: 2904 Message: 2924

Jim,
Seems to me like your trying to fix something that isn't broken.....Doesn't seem like something the Jim we have all grown to "admire and respect" cough, cough, splutter, splutter, with so little time and so much to do would do??? :-)))
33nf Cap, not all that long ago actually, although I may not have ordered it as a 33nf, probably as a 33,000pf or a 333.

Was just wondering whether to do the extra "power" mods to the hire radios....I dont think so. While they're working .....must admit the term nf got me. How long since you asked for a 33 nanofarad cap? Being brain dead at that time of night didnt help. I should of left it till today. Or maybe not, son rang at 6am . He was over at the new g/f's place and his car wouldnt start. Could I get up, drive 20k and take him to work ? I always was a sucker !

I did. Its a typical round speaker found in laptops and old
transistor
radios, about 3" (showing my age) round. Still doesnt help, I'll
have
to
try
Trikky and the local lectronics shop.....its only 30 k through
traffic
:((

2925. source of xtals for 7726 radio

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-06-10 04:25:16 UTC
From: frank
Topic: 2925 Message: 2925

Greetings All,

looking for a good cheap supplyier of quartz xtals for a old 7727c
looking for a set of vks737 freqs, radio has got 2,4,6 9 mhz freqs
already got both coil freq types so only need the rocks and tweak the
caps on the coils.

I recall someone here said some firm around does $20 per rock or is
there a bundle set bulk price.

Regards

Jim,
I would doubt it :-)) I hate pulling them apart, every time you think they are fixed, seal them up, they don't work, have to pull them apart again, silicon all over the hands.....

I have the distinct impression that you probably would have done a better job, thank goodness for the Big Pond :))

Cheers
Jim

I never seal em until the double beeps indicating tune. So this one is still
unsealed :((
Cheers

Yes Jim, a bit late by the time I checked my email though. A bit cold uo here, thermometer passed 7 degrees at 9 pm and is still going down. So much for the Tropics.

Sam.

Yep, been in Cairns when its 6degress at 0700. Brr.... all that expansion and contraction in the radios and aerials can't be good. Might help to explain why my main aerial doesn't seem to swing from the trees for more than 6 months before I have to go and meet the ants again.

Cheers
Jim

Worst thing about doing it that way is that even when you get the double beeps you still have to remove it again to seal it :-((

2943. Bullbar antenna mounting bracket

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-06-19 10:19:47 UTC
From: ia_dave
Topic: 2943 Message: 2943

Hi. I'll be lucky enough to be purchasing an 8528R at the end of this week. Will mount antenna and use set probably once a month for a weekend, and once a year for a month.

I went to a reputable bodyshop to get a 6mm bracket welded to my Prado's alloy bullbar for the whip antenna, but they were sceptical it would hold, estimating the bullbar metal to be too thin.

After speaking with a local radio installer they decided to attach a bolt-mounted antenna bracket, wrapped around the bar. My understanding however is that the bracket must be welded.

Can anyone please give me advice as to whether I should be concerned about this antenna mounting method?

Thanks.

Best regards
Dave (Sierra 8613)

Dave, without seeing it, a bit difficult. However I'd go with the radio installer.I have used them and haven't had a problem. Mind you for whip aerials and not auto tunes.

Cheers
Jim

From: Sam Point
Topic: 2943 Message: 2945

Dave, I've mounted 9350 Autotunes on a couple of Jackaroo and Pajero
factory supplied alloy bars with clamp on brackets. The brackets I had
tomake up
as work coudn't source one locally that would "grip" and didn't want to
wait for some to be sourced in Brisbane. One was made from 2" wide by 1"
deep steel "U"
channel and the other out of 9mm plate 2 " wide. The antenna mounting
hole was placed close to contact with the top bar of the bullbar with
enough clearance
for the nut and washer (Use an open ended 24mm spanner to tighten.) and
the whole lot held on by two 2" U bolts (Stailnless or gal depending on
bar type.)
fastened to the bar next to the Uprights and with the bits to the front
rounded to match front strap profile. The reason I had to do this type
was that both bars
had a type of "Hammertone" finish which gave a "dimpled" finish and the
band type mount coudn't get a sufficient grip around the bar.
Both type have served well for over 12 months in the Trpical north
travelling through rainforest, creeks, coastal mudflats and gibber
tracks, all without slipping!
Mind you on removal there where 2 "bands" embedded into the bar :-)
maybe I did them up too well! All threads had been cut off at the top of
the nuts by
the way as well, so no sharp bits poking up.
Oh yes the "U" channel was "Profiled" to the top bar so it "wrapped"
around it.
Sam

Defintely agree Sam, I have had my auto tune mounted
in the same fasion - 9mm plate secured to the bullbar
with 2 "U" bolts fot the last four years without a
problem. Of course make sure that there is a good
ground and you will find it works without a problem.

hello group

i know this might seem a stupid question but i have beeen a lurker for a
litt\le while now from a technichal point of view but i have recioved a HF
COMMS RECIEVER AND CANT find anything to listen to i am in the
monington peninsula victoria i can currently hear vmc can any one tell me
any hf stations that are worth listening to that have a reaasonable amout of
traffic

thanks

john remington

Date: 2004-06-21 00:39:40 UTC
From: Jim
Topic: 2947 Message: 2948

Hi John. Don't despair, the frequencies are full of traffic at certain
times. Try 8022khz at 0830 to 0930 and again at 1700 to 1900.
If you do a search on Google you'll find heaps of other interesting
frequencies, it all depends on what you are interested in listening to.
Cheers
Jim

hello group

i know this might seem a stupid question but i have beeen a lurker for a
litt\le while now from a technichal point of view but i have recioved a HF
COMMS RECIEVER AND CANT find anything to listen to i am in the
monington peninsula victoria i can currently hear vmc can any one tell me
any hf stations that are worth listening to that have a reaasonable amout
of
traffic

thanks

john remington

Topic: 2950 Message: 2950

Hi all
just a reminder, please edit the extra 'crud' from your posts. It makes life a lot easier for those who are on a slow internet connection and/ior receive the daily digest.
Thanks
Ben (moderator)

Hi Jim, and everybody else.
Yes, I fitted the radio on Sunday, and all appears to be working
fine.

I will get on one of the sked one of these nights, and have a chat :-
)
So far I have been listening/lurking .

Cheers,

Stefan.

Hi,

Why do you say that?
Would moisture cause a problem?

Jim said' Just don't wash the car too often :-) '

Also, would you know the schedules for the Bush Telegraph network,
they don't appear on their website?
I have the VKS737 that I joined

And on partially of topic question, with regards to the phonetc
alphabeth, what is the correct code word for Z, is it Zebra or Zulu?

Cheera,

Stefan
Quebec 2831 :-)

I was referring to the fact that the setup only stopped working when Craig washed his vehicle at Uluru.
I'm not sure that BT actually have a schedule as such.
Z used to be Zulu if I remember correctly, but either phonetic will get the message across :))

Cheers
Jim

From: Brian
Topic: 2947 Message: 2955

John,

I would have thought that with all the experience in your communications company http://jmrtrading.cjb.net/ and the fact that you are a Codan and Barrett dealer by the looks of things along with numerous other manufacturers products, that you would actually already have your hands on some decent HF frequencies.

If you don't happen to have those resources though, there should be plenty of stuff in the files section of the group, or on the ACA database.

Brian.

2956. Re: Digest Number 647 - HF frequencies

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-06-26 00:56:32 UTC
From: Mike Richter
Topic: 2947 Message: 2956

John

1. If you have a look in the files section of this group -
http://groups.yahoo.com/group/codan_outback_radio/files/Frequencies/
you will see a list of frequencies I have in my Codan that should
keep you busy for a while.

2. When replying to a message, please take the time to delete
unncessary parts of the original - your 9 line message takes up 9
screenfulls for those of using Digest mode. It makes it very slow and
wasteful of download space.

Mike

Hi Jim/Stefan - yes the correct phonetic for the letter Z is ZULU. This is part of the internationlly recognised phonetic alphabet that has only one recognised word for each letter. There is nothing more irritatin than listening to people make up weird and stupid words when they are trying to get their message across. Particularly when talking with people whose primary language is not english, using non standardised phonetics makes it much harder for you to be understood. I have found that the yanks are the absolute worst when it comes to the use of non standardised phonetics - although some Aussy amateurs are pretty damn bad as well.

Matt

G'day all,
Ive just joined the group to learn a bit more about the Codan HF radios (obviously). Ive just put an order in for a black face 7727 from Jims web site. Hopefully i'll get some good use out of it while pottering around up here (I live in Mt Isa). I intend doing quite a bit of exploring in the 4WD. Im just scratching my head now trying to figure out how to mount it. Its a local control model I believe and its going in a 97 model dicovery. It'll take me a while to get it organised and registered through VKS737 Im more used to using the newer CODANS through work with an auto tuning antenna. Anyway greetings to you all.
Cheers
Mick

G'day Jim,
Thought you might be on this forum ;) Im looking at sticking it on the back of the centre console cubby facing up, if you know what i mean. that way the speaker and mic are handy. Ive also just seen a remote head for a 7727 on e-bay that i just bid on, i didnt think they had that option. Hopefully the e-bay Gods will smile on me but i doubt it as i dont want to through to much money at it while not knowing what im doing.
Cheers

Hi Mick, well the 7727 is a nice basic radio and much cheaper than most.
Nice to "get your feet wet" so to speak. But you will outgrow it as soon as
your disposable income rises :)
As far as I know, the 7727 were either locals or remotes. The locals (like
yours) couldn't have a remote head, and the remotes couldn't have a local.
Generally speaking. The later 8525's, 8528's could have. There may be a 7727
model that has both but I haven't seen one here.
Not sure about mounting as I've never owned a disco. I'd say anywhere handy
that isn't in the way
Cheers
Jim

As far as I'm aware that's the situation. Others here will be sure to tell us otherwise but I've just checked the 7727 and there's no remote interfaceon it.
Lotto ? Obviously you don't work at the mines there in Isa. I was told those blokes don't have enough to spend their money on :-)

I always knew I was in the wrong business ! Mind you my FIL was killed in a mine accident years ago, they can have it.
Still you're nice and close to the RFDS there. And that rotten road up the mountain to the west out to Three Ways. And the track south west down to the Plenty (of nothing) Highway. Lots of good places to play 4wd in your neck of the woods.

Cheers
Jim

Date: 2004-06-28 09:00:34 UTC
From: Stephane GRANDGIRARD F1SRX
Topic: 2966 Message: 2966

Hello all,

i m F1SRX in France.
I have a Codan transceiver (8525 B) and a 7113 B power supply.

I need information about this power supply : i a looking for the instruction manual and elctricals drawings.
At the rear of this power supply, it has 2 plug (1 male and 1 female) : which must i take to power the transceiver ?

Thank you for your help.

Stéphane.

Hi Stephane. The 7113 has an output for hi amps and an output to "float" a 12 battery. If you take the top off you can see which one has the thickest leads (Hi amps).

Cheers
Jim

More on the 8528

I powered it up this weekend. Some of the channels display an error message along the lines, failed to unlock or unlock failed. Any ideas?

The autotune failed to autotune too....

Gidday

I have been "given" an 8528 to try an sell (long story). Its was purchased in 91, used for about 12months and put in storage. Will be testing this weekend. It has the 8558 autotune antenna and 8531 head.

Assuming it works OK, any idea what its worth?

cheers

Hi Brian. Sounds like a repair job :(
However before doing that, open the box up and check to see if the LED's on the "short board" are alight indicating the PLL is unlocked.
Push down gently on the connectors that have pins coming through, sometimes the connectors can become dirty/dusty, especially the bakelite ones. (brown).
If you have a multimeter and a copy of the manual (Ben's Codan site), check to see that A, B, C, D supply voltages are correct. Basically most of em come off voltage regulators which are easy to replace.

They are a few quick thoughts off the top of my head. Hope they help to clarify your thinking.

Cheers
Jim

In addition to the A,B,C & D rails, which are fundamental, the technical service manual also gives full instructions for adjusting the VCO1 and VCO2 voltages. If some channels are OK, I would suspect that everything is functioning, you probably are just on the edge of the loop capture range. A quick whizz round the VCOs should see you right.

wrt the auto tune. Are you using a 9350? Do you get a low on pin 4 when you hit the Tune button? If so, you should suspect the cable or antenna.

Good luck

John

2973. 9323 Service Information availability

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-06-30 05:12:27 UTC
From: Mike Richter
Topic: 2674 Message: 2973

I enquired about the availability of this information from the Codan Service Centre. Their reply (which they approved being copied here) is -

"I am responding to your request yesterday about the discontinued Codan products CD. The information on this CD was compiled for Codan Dealers only and I am unfortunately unable to provide you with this CD. Codan dealers have done many years in radio electronics training and their companies try to make a living from servicing/repairing electronic products. It would not be fair for me to provide service information to anyone outside the Dealer chain. I trust you understand my position in this matter.
If your equipment requires servicing, I can provide you with details of your closest Codan Dealer.

Mike

Hi Jim,

I do not know re the problems with the head and 9350, just that when I swapped them in and out of a working system they did not work. I did this about a month ago and labelled them as not-working when I was getting the last working complete system together to sell.

They would have been on today except my PC blew the power supply last night so I had to get a replacement to get going just 1/2 hour ago. Cheers,

Peter

From: Graeme and Lillian
Topic: 2980 Message: 2980

Hi Codan HF group.

I wish to purchase a Codan 9323 remote head radio. Do not need an antenna as I want to replace the 8528 radio I have in my vehicle at the moment. The 8528 once replaced will be auctioned on ebay if not sold sooner. I am interested in playing with the GPS function in the 9323 for the Automatic Packet Reporting System available to ham radio operators. I can be emailed either through this group or off line at graeme.lillian@...

Graeme

From: Richter, Mike W
Topic: 2982 Message: 2982

Graeme

... and I should have added.

You can do HF APRS Transmit-only using a TT3 board for Aus$50 - GPS data in and Audio Out to go into any Codan.

The Selcall Decoder has an FSK Modem in it which will allow you to receive Amateur Packet or APRS. It is designed for 170Hz shift (Amateur is 200Hz) but I think it will work without modification. It will go into a VHF-type TNC (set to 300Baud) and then an iPAQ. You will be able to monitor and record traffic without having a laptop or iPAQ running.
- or you could use Soundcard input if you have a laptop with you.

APRS - Automatic Position Reporting System for Amateur Bands, allowing your position to be viewed by anyone with Internet access.

Graeme,

Just a word of caution about purchasing a second hand 9323 with the intention of using the GPS function....

Some Codans were sold new with the GPS enable password provided as a special deal at that time, but if you buy one and then have to contact Codan for the password it will cost you $$$$$$$$. I think for them to provide the password to enable GPS is in the range of $300. I went through a similar process when I was planning to upgrade to the NGT, but the cost involved was just not feasible.

Good luck finding wone with the GPS password.

Cheers,

Mark

ps Mine came with the password for GPS and Emerg. Selcall as a bundle when it was new, but not selling...sorry.

Mike, just something. We can currently do a Location query to GPS
equiped 9323 mobiles from our 9323 bases or mobiles if
you have an ascii terminal plugged into the rs232 port on the rear of
the 9323. This is dependant on having the GPS option fitted
first of course plus some of the radios attempt (If they don't have a
GPS plugged in.) to include GPS poition data in an emergency call
as well. This option is fully active (If you turn it on) in the new NGT
radios with the GPS option.

Well, it's only down to 13 degrees so far Jim!
Oh yes, Q from my Mt Isa compadre, anybody have any spare 6924 channel
elements? Friend just purchased a 6924 with only
3 odd ball channels fitted and wants to fill it to 10 with RFDS channels
for QLD and NT / SA. I don't have any to spare but depending
on what the frequencies of the odd ones are we may be able to get him up
and running with basics once he lets me know the frequencies.

Now off into the Tropical arctic evening for a round of shopping with
the kids!
Back on later.
Sam.

Had a peek at that URL but couldn't locate the $250 in the new/annual column.

Nevertheless, it COULD be good news depending on how we should interpret that. For example, in OZ waaaay back each mobile in a repeater network attracted a *per-set* licence, which went as high as $A35 at one stage. As the person responsible in a govt agency for ensuring we were properly licensed, I can tell you that was one real bugger of an arrangement. Then they introduced the system licence, where the fees were all aggregated onto the repeater in effect. After that, licensing for us (me) became a real breeze.

It's a damned sight easier for THEM to administer, and if your network has a large enough number of mobiles (per base/freq) then it will pay off for the user. An example here is the AN4WDN - thousands of users operate without a specific *per-mobile* licence. Just imagine that one requiring an ACA licence PER SET!!

Just my 2c worth.

Peter

JIM & all others on the group - if anyone offers you a 9323 for sale Serial No D0390 give me a yell - its stolen.

Some mongrel stole my mates 80 series Srandard 'cruiser down here in Melbourne at the recent fishing show, the rig was fully setup for cruising the big country & was complete with 9323/9350 & many other extras.

If you see a White 80 series with chrome sunrasias, alloy roof rack, oposite lock towbar with rear tyre carrier on the Right side, GME 3200 uhf, Fluro interior lights, roof console mounted 9323 head, Rego NES 845, VIN JT711PJ8008009804 give me a shout.

The Radio boots up with Barry Wells in the welcome screen - Baz is the one with the witdrawl pains after having the cruiser nicked.

Thanks for your help.

From: Malcolm at "On-Track4wd" in Greymouth
Topic: 342 Message: 3002

Hi Peter,

Way back in NZ time our licensing structure for repeater frequencies used to be the same. Unfortunately, due to the propagation characteristics of HF channels charging on a per frequency basis has some limitations.
1) We are restricted with higher frequencies (above 5 MHz) to use them during daylight hours only. (Licence condition).
2) Because of propagation characteristics we do not have the(useful) use of all frequencies at any particular time of the day.

The use of HF in NZ is on a real minor scale compare to Australia. Most of the sets are owned by small business for their own use. These businesses usually have 2 or 3 frequencies to cover the propagation effects at different times of the day. They currently pay on a per set basis as the sets are covered by an apparatus licence which includes the frequencies which are or can be installed in an particular radio in the group.
If they are going to look at increasing the fee structure then they have to readdress the whole situation as we are not allowed frequencies in our sets which are not covered by our licence. Therefore, if for example I wanted to put in VKS737 frequencies I would have to pay $250.00 per year to have them in my sets. I am heavily involved with NZ Land SAR and have the 2 SAR frequencies fitted to my radio's so they can be used on a SAR operation. Why should I have to pay $250 per year for each of these 2 frequencies when I don't use them on a day to day basis???

In theory, one person could hold the licence for one frequency and everyone could have access to it, basically for free. No one would know how many sets were on their frequency, no doubt you guys have this problem now with sets being easily programmable. Most sets in NZ(other than Amateur sets) are still crystal controlled which has the tendency to make the addition of frequencies limited.

No doubt there is a way of sorting it out, I just hope that its not done the way things normally are over here. i.e. just send a bill out to every licence holder for frequencies x $250.00

Anyway, that's my 2c worth. I'm of 4WDing till Wednesday afternoon. I've made a submission already.
Regards,

Malcolm Langley.

Certainly in the Oz system the licence fee is per frequency for THE NETWORK. So in the case of your SAR stuff, the lcience would be held by the SAR organisation itself, and all the mobiles would be covered by that network licence.

Slightly O/T, but we had a case where many of the 200+ mobiles on one of our VHF networks were also participants in the Bush Fire Service network. Our forest management agency (CALM) also have a firefighting role (in crown land) and many wanted those frequencies fitted too. Under the old licensing system, this was a major PITA. The current regime meant that theyw ere covered by the network licences as long as their "right" to have those freqs fitted was documented. Same applies to a few agencies I do work for that rea uthorised be be on WA Police freqs - once-off documentation.

Not having been able to view the instigating document, I can't be sure how the NZ proposal works. Certainly the Oz model will penalise the small fleet. The breakeven here was about ten mobiles on VHF/UHF when the arrangements changed.

> In theory, one person could hold the licence for one frequency and everyone could have access to it, basically for free. No one would know how many sets were on their frequency, no doubt you guys have this problem now with sets being easily programmable.

That's the concept. No-one wants or needs to know how many mobiles. The ACA conceded at the time of the switchover that their database indicated MOST rural operators had a base and two mobiles. Yeah, right, sure ....

>Most sets in NZ(other than Amateur sets) are still crystal controlled which has the tendency to make the addition of frequencies limited.

> No doubt there is a way of sorting it out, I just hope that its not done the way things normally are over here. i.e. just send a bill out to every licence holder for frequencies x $250.00

If they are listed as separate entities all holding separate licenses then that is a high probability IMOE. There may be an urgent need for "networks" to be identified.
>
> Anyway, that's my 2c worth. I'm of 4WDing till Wednesday afternoon. I've made a submission already.

See your 2c and raise another 2c ;-)

the
> Selcall number is??
> Thanks very much!

there are 2 selcall setup, the codan factory install using thumbwheel
switches on a local 7727 or a microphone and controller board on a
remote 7727.

the microphone selcall there are a couple of aftermarket setups, most
using a private signalling HF selcall protocol, ones i have manages
to find, there is a guy in WA selling selcall/telcall microphones.

the cable for the remote 7727tb is a DB25 to a 36way AMP connector,
good luck finding the AMP connector, like rocking horse poo..hard to
find.

Regards

Graeme,

Some Codans, including mine (fortunately) were sold with a package that included the "Emergency Selcall" and "GPS Enable" passwords. These were usually the ones sold through the various 4WD shows etc..

If you have to 'purchase' these options from Codan they slug you between $200 - $300 and you need to give them your ESN, from which they work out the 'password' that enables these options.

Cheers,

Mark

Graeme,

To display your radios ESN, repeatedly press the 'mode' button until you see the setup menu, then type in 42 on the mic buttons. The 14 digit transceiver ID should be displayed.

It is described in section 7-5 onwards of your reference manual under "Password entry to enable transceiver options".

With my radio there are 2 separate PIN numbers for the GPS option: one to enable and another to disable, whereas the emergency selcall option only has one to both disable and enable.

Passwords are 12 digits, somehow generated from individual radio identification codes.

It would be interesting to see the current pricing of these options from Codan, as my recent enquiries were for the NGT.

Good luck,

Mark

Am slowly researching installation of an HF into my Landcruiser (100 series V8).
I am led to believe that one can expect some RF interference with a modern vehicle such as I own - which may even preclude using the unit whilst the 4wd motor is running. That being true might influence me into installing the beastie in the back next to the Engel - which would make it even more convenient to enjoy a glass of good white whilst chatting, tweaking knobs, pushing buttons and generally wasting time !! (giving SWMBO time to prepare me a fine dinner such as I am accustomed to on chilly July nights out in the desert).
I would appreciate any insights into this issue.
Cheers,
Lurker.

Lurking and drinking, interesting pastimes :)) Some modern vehicles do spray more than fuel around and you're correct, yours is one of them. However running the radio when stopped also draws power so one would have to be careful if relying on the two starting batteries. After all, warm wine isn't very exciting. However I can appreciate that spare cash for extras may be difficult to find as I'd guess most of the funds go towards cooks wages :)) You can console yourself with the knowledge that 99% of the time that you need to use the radio the vehicle will be stopped anyway.

Cheers
Jim

Many thanks for this info Jim.
The V8 uses only the one battery - the second I've put in for the Engel / wine (the turbo diesel has the 2 starters).
Its difficult to fit anything else in the dash of the cruiser - it sounds like down the back
may be the go.

It depends upon which model radio you have. I've found the smaller remote heads fit almost anywhere. Of course your dash is probably full of DVD screens and GPS/satphone gadgetry. Good stuff till they get a bit of dust and corregations into em. Then I'm afraid its time to get out the maps and tell the kids to make their own fun .
The main decision about radios is where to mount the autotune. On the rear K Mar for the lucky ones. If mounting on the front be aware of insurance problems in the event of an accident.

Cheers
Jim

Oh no, you've put me in the wrong mould Jim....a CD player (for Leonard Cohen) and a UHF has filled the dash....we go bush to get away from DVDs and the like.

> The main decision about radios is where to mount the autotune.

I'm actually thinking of something pretty basic in the back which I can plug into a tapped aerial mounted on the rear wheel carrier and into the 12v outlet in the back.
cheers,
Brad.

Oh dear. A V8 Cruiser with something basic ? Now that would never do. A
9323 or NGT at least :)
Actually unless you want to worry about technicals I suspect that you can
still get by with a pretty basic setup. Some people think that a 400 channel
unit must be better than say a 10 chan unit. Then they go bush and use
perhaps 2 channels.
But in a Cruiser ? Think of the image :))

Cheers

Hi Brown Snake Lurker,

I drive a 100 Series Diesel Cruiser and have a 9323 installed in it. Due to the fact I had a heap of other radio gear to go in the car as well, I was a bit limited on where I was going to put the remote head and the unit. In the end I ended up putting the reote head in an overhead console and the main unit bolted to the rear of the cargo barrier down the back. The Auto tune I mounted on the Kaymar bracket at the back, but unfortunately it is far too low and I'm thinking about making a bracket to boost the height of the Auto tune.

There are a couple of places you might be able to mount the head up on the console and there might even be a couple of pictures in the photos section of one or two. The other thing you could do is to get a dash pod console and mount the head in there.

Of course if you want to run the radio from the front and the back of the car you could always buy a non remote head Codan unit and then add a remote head to it (very easy to do - but no doubt expensive when it comes to Codan).

Brian.

havent you ever sat around the camp fire with a nice warm bottle of port???

perhaps the best antenna option for a 100 series would be an integrated spare wheel carrier and antenna mount on the rear. I know they are a pain having to open them seperately everytime you open the back, but a 2nd spare never goes astray. it can always be removed when you get back home again?

cheers ben

Actually Ben, no. At one stage I tried scotch and coke but couldnt get up
early in the morning :)) I've found that if I want to drink then it's best
if I wait till I stop somewhere for a few days. Don't know about anyone else
but I need all the concentration I can muster to drive. These days I'm silly
enough without imbibing, and find that an early night in a nice warm
sleeping bag, fully clothed with ski gloves and beanie is preferable to late
drinking sessions around the fire.
Besides, the furry tongue doesn't help one communicate well on HF. I can
remember being asked once where I was and suddenly realizing that I had no
idea. I knew where I was going, where I had come from and which track I was
on, just couldnt gather my thoughts about where I was.
Ahhh the joys of getting older.....NOT.

Cheers
Jim

I'm interested in making up a long wire antenna to carry in the back of the 4wd as an emergency antenna, I've got the formula to get the correct length and am confident that standard insulated coper wire (240v lighting wire) will do the job fine, however I'm confused as to how to earth the antenna. I've heard you can just connect the wire directly into the spring base or directly into the back of the radio, but if you connect direct to the radio, where does it earth? Do you have to earth the connector to the car or somthing??

Jeff

You're right in your concern over there being a need to have an earth.

When you are driving, the whole vehicle acts as an "earth" or counterpoise which really becomes the other half of any antenna.

When you are stopped, and you decide to use a longer 1/4 wavelength antenna, you will get a better signal, even though the counterpoise is still the car (which is less than a 1/4 wavelength at frequencies below 20MHz).

So if you find that signals are still too weak with the 1/4 wave antenna, you can improve signals further by having a 1/4 wave counterpoise. Connect a 1/4 wavelength wire to the chassis near the antenna and run it out in the opposite direction to the antenna, about 1 meter above the ground.

Years ago common wisdom was to connect to an earth stake, however much recent testing has shown that you get better results if the counterpoise is run above the ground to avoid earth losses.

Mike

Subject: Re: [codan_outback_radio] Digest Number 666

I'm interested in making up a long wire antenna to carry in the back of the
4wd as an emergency antenna, I've got the formula to get the correct length
and am confident that standard insulated coper wire (240v lighting wire)
will do the job fine, however I'm confused as to how to earth the antenna.
I've heard you can just connect the wire directly into the spring base or
directly into the back of the radio, but if you connect direct to the radio,
where does it earth? Do you have to earth the connector to the car or
somthing??

3030. RE: [codan_outback_radio] Counterpoise

Yahoo group: codan_outback_radio (1997 — 2004)

Topic: 3029 Message: 3030

My answer was in the context of Jeff throwing a length of wire in the back as an emergency aerial.
If he had enough wire, a simple wire beam could be constructed which might improve things.
However in the event of an emergency I very much doubt that this would be on the cards.
I have built, tested, used, marketed and sold the simple 1/4 wave wire as an emergency aerial. They can be packaged in a bag small enough to fit into a toolbox. Mine had several connectors on one end, and the two frequency (8022 and 5455) operation.
Testing involved the use of the worst case scenero, the end tied to a shovel. The other end was either plugged into the hire suitcase aerial earthed only to the battery (no bitees) or connected to the end of the coax (not an ideal situation as the aerial end Z varies somewhat :).
They were tested over terrain varying from sand dunes to boggy soil.
Connecting the radio case to the car body or to an earth stake did little to improve the perceived strength of the tx or rx strength at the time. No doubt further testing on weaker base station sigs might of told a different story.
I didn't try a counterpoise as these aerials were supposed to be tested under conditions similar to what they were intended to be used for, a quick and dirty answer to an emu strike, rollover etc.
Oh...and they worked quite well :))

Cheers
Jim

Tis ok Brad, for some inane reason I feel obliged to lash out with such feeble attempts at humour occasionally. I suspect it comes from years of exposure to Mac machines which I neither enjoyed, understood fully nor appreciated . It may have had something to do with the fact that I found programming easier in the Windoze environment at home.
Cheers
Jim

Thanks Mike, that makes more sense to me, so in essense I'm making a crude dipole. So in theory I should get a pretty awsome reception out of it if I place it correctly. Might even set one up at home for listening to VKS-737 Scheds while the car is in the garage.

Thanks guys.

Jeff

DC Current only flows when there are two wires for "go" and "return" - and that applies to RF to aerials as well.

In a dipole both wires are equally elevated and it is obvious how both radiate.

With vertical antennas it is less obvious, but there has to be a "return" connection. In a handheld radio e.g., CB the "return" can be the case or the operator. For lower frequencies, it will only be efficient if the "return" is pretty large (although I have used handhelds at 2.8MHz !!!)

Jim's message reminded me that I need to think more broadly - I was only thinking of operating from a vehicle rather than a portable set !

The traditional thinking for vertical or sloping antenna is to get the "return" by connecting the radio chassis to a ground spike - the problem with this is that most ground is quite lossy so it is like using high-resistance wire for an antenna. Some people used to bury the earth wire to get the best of both earth's, but this is still less efficient than a wire half a metre above ground level. Ideally several wires should be run out from the chassis.

So is a wire run near the ground the "other half" of a dipole or is it a counterpoise ?? I don't think it is black and white. Remember that at HF you can lay a dipole on the ground (providing the ground is lossy) and you will still get a reasonable signal.

One thing is clear though - you will get a better signal if you connect two quarter wave's - one for the "go" and one for the "return" - providing you have the time and the space to run it out.

3034. NGT

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-07-24 06:16:23 UTC
From: Jim
Topic: 421 Message: 3034

Just had my 6 monthly phone call from a southern customer who'se very much involved with the 4wd networks etc. He tells me that the Codan NGT now comes with or without the data facility, and that without it makes an NGT a bit cheaper. Can anyone confirm the fact that the puchase price has actually dropped for non data NGT's ?
Cheers
Jim

Ahhh! One of the few Codan things I may know more about than you
Jim! Yes, last December Codan increased the RRP of the NGT AR from $4100
to $4900 (of course no one buys at the RRP). At the same time they
brought out the AR Voice model at $1400. Main obvious difference is no jn
box and correspondingly no data capability. So net affect is no real
difference to the average au 4WD user as most did not want data when the
Codan modem was about $3K anyway. Also, BTW the long awaited A option for
he NGT should be out in a few weeks (but its been a few weeks since last
Christmas),

3039. Re: [codan_outback_radio] NGT

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-07-24 23:09:48 UTC
From: Paul
Topic: 421 Message: 3039

IS that right...

$1400 for an NGT voice only? I dont know much about them so if my questions are of the mark you will no why..

If at a later date I wanted to get the data options is it a software upgrade (flash ??) or some hardware is needed to. (jn box ??) What are the features that a user would miss out on without the data options??

Regards

Paul

Peter Cattell <cattellp@...> wrote:
Ahhh! One of the few Codan things I may know more about than you
Jim! Yes, last December Codan increased the RRP of the NGT AR from $4100
to $4900 (of course no one buys at the RRP). At the same time they
brought out the AR Voice model at $1400. Main obvious difference is no jn
box and correspondingly no data capability. So net affect is no real
difference to the average au 4WD user as most did not want data when the
Codan modem was about $3K anyway. Also, BTW the long awaited A option for
he NGT should be out in a few weeks (but its been a few weeks since last
Christmas),

Hey Jim, the last 2 NGT's we received where AR VOICE models. They still
had a GPS option with a 4 pin fly lead
RS232 I/O (Small plastic 2+2 format) coming out with the head/microphone
fly lead, so GPS Data and CICS (Codan
tranceiver computer control system) still works. Will try to get the
data onto the site but info is in the manuals with
the NGT's in PDF format. Unfortuneatly no fax or normal data mode though
so far.

3044. New Member - NGT

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-07-25 22:05:14 UTC
From: Grey & Kerryn Campbell
Topic: 3044 Message: 3044

I am a new member currently travlling Aust by 4WD. I have a landcrusier turbo diesel with a NGT installed.

I get too much interferrence while the car is running to use it. I have tried 'easytalk' function but it doesn't really work.

Can I fix this problem or is it a just pull over and stop and live with it?
Regards
Grey

Having the data option (NGT AR as opposed to NGT AR Voice) per se does not give you any extra functionality unless you add a data modem for email/FAX/etc. The Codan modem is about $3000 so no wonder very few as far as I know have been sold in au. All NGT's sold up until last December were AR's so if you pick up a second hand one of these at least you may have the option of adding a modem later.

However, if you really want hf data the cheapest way is to become a ham as 2nd hand hf ham modems may be bought for about $300. That is the way most yatchies used to go pre satellite (and many still),

Hi Grey. Some of the later TD Cruisers had a form of diesel injection that isn't radio friendly to say the least. I'd love to be optimestic and recommend interference supression devices but I'm not sure that they'd do any good. Which model cruiser is it , the 100 series ?

Cheers
Jim

An 8525 without selcall I've just bought has a SigTek board where the selcall board should be. It has its own audio out and a bunch of wires going to a non Codan socket at the back.
Obviously some kind of signalling device , can anyone throw any light on these? Perhaps they were used in tonecall equipment at UHF ?

Cheers
Jim

They usually have a number like T2801 "T" for time out pcb, S2801 "S" being a signalling PCB.

How many wire outs??? 8 or 10??? could be a monitoring PCB for external info like site monitoring etc. Take a pic and send it to me.
Regards,

Malcolm Langley.

An 8525 without selcall I've just bought has a SigTek board where
the
selcall board should be. It has its own audio out and a bunch of
wires

going
to a non Codan socket at the back.
Obviously some kind of signalling device , can anyone throw any
light on
these? Perhaps they were used in tonecall equipment at UHF ?

Cheers
Jim

Greg,
Yes, and you want to see what it does on the Holden Jackeroo (Isuzu bighorn) I did things like straps motor to chassis to body, body to exhaust pipe, bonnet to body, computer to body, battery -ve to body and only got rid of about 70%. At least I can now use it while driving. Before I started I couldn't even mute the radio.
Not very promising for the future. What frequency is it at its worst??? mine is around 7MHz which is of course my primary operating frequency.

From: John Jacobs
Topic: 3044 Message: 3058

Most of the noise generated in these new vehicles s due to the high pressure diesel pump. Partly the high voltage used and partly the static generated by the diesel fuel as it rushes thro' non-conductive pipes. As the engine block and and exhaust pipe tend to be suspended on rubber mounts, this noise has no earth path and the exhaust pipe acts as an antenna radiating the hash. An earth strap from the tail pipe to the chassis usually reduces this to a manageable level.

At risk of teaching my granny to suck eggs, can I suggest you identify the source of the noise, rather than trying to fix everything. Is the noise worse when rolling or stationary? When standing, does it increase with revs? Once the source is found, the cure is usually easy!

Good luck

John

Hi

I have worked on 100series turbo with codan NGT's professionally and yes
they are bad.

Have tried many filtering tricks but can only reduce it a bit.
Its worse on the back of the vehicle near the back passenger side. The
main wiring loom is here.

On the right frequencies when you transmit the engine will stop.

A really good ground will stop the engine stopping and reduce the noise a bit.

I found on a Range rover the nose was bad at the back of the car but much
improved on the front. But the range rover suspension computer will go mad
if you again transmit on that magic frequency.

Toyota will only help if its a Toyota approved equipment, tell me if you
know of a HF radio that toyota makes.

Yep your right, you are teaching us how to suck eggs, the Holden Jackaroos have electronic injectors, the Triacs that's witch them create the high voltages needed to fire the injectors which create heaps of noise like a spark plug to say nothing about the computers. They don't even have a diesel pump. The computers cause all the noise in the landrovers. Been there, seen the movie and got the teashirt.

From: d zilm
Topic: 3044 Message: 3061

Most common rail diesel engines will also fall into the electrical noisy category.

the Jack is one of those. Others are typically of European origin, but expect to see more from Japan real soon.

"Malcolm at \"On-Track4wd\" in Greymouth" <on-track4wd@...> wrote:
Yep your right, you are teaching us how to suck eggs, the Holden Jackaroos have electronic injectors, the Triacs that's witch them create the high voltages needed to fire the injectors which create heaps of noise like a spark plug to say nothing about the computers. They don't even have a diesel pump. The computers cause all the noise in the landrovers. Been there, seen the movie and got the teashirt.
Regards,

Malcolm Langley.

Most of the noise generated in these new vehicles s due to the high pressure diesel pump. Partly the high voltage used and partly the static generated by the diesel fuel as it rushes thro' non-conductive pipes. As the engine block and and exhaust pipe tend to be suspended on rubber mounts, this noise has no earth path and the exhaust pipe acts as an antenna radiating the hash. An earth strap from the tail pipe to the chassis usually reduces this to a manageable level.

At risk of teaching my granny to suck eggs, can I suggest you identify the source of the noise, rather than trying to fix everything. Is the noise worse when rolling or stationary? When standing, does it increase with revs? Once the source is found, the cure is usually easy!

Good luck

John

Grey & Kerryn Campbell wrote:
I am a new member currently travlling Aust by 4WD. I have a landcrusier turbo diesel with a NGT installed.

I get too much interferrence while the car is running to use it. I have tried 'easytalk' function but it doesn't really work.

Can I fix this problem or is it a just pull over and stop and live with it?
Regards
Grey

3062. NGT display contrast

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-07-26 12:26:37 UTC
From: Adrian Waiblinger
Topic: 3044 Message: 3062

Has any body had the problem with the NGT display contrast.

The fault is the display is black, when you go into the control menu and set the display contrast its already on 1/2.

Just adjusting the setting fixes it.

I have see more that 5 NGTs do this.

Regards Adrian

Its quite funny how the serious 4x4 vehicles bread and butter are remote area driving and they are not HF friendly!!

Ok will not teach sucking eggs, gets a bit boring.

Just dont get in a situation like I did when somebody decided to selcall me when trying to over take. Does not mix!!!! (Toyota 100 series)

Hi Adrian,
Yep, know all about the arguments about taking these vehicles into outback areas. But what can you do??? The vehicles are made for 90% of the population and 90% of the population never take their vehicles off-road. Japanese are great at making electronics and all the wixzz bangs are what 90% of the population want. And besides I have no doubt the answer in Japan would be 5 meg??? 7 meg??? what the hell are they used for and why on earth would you want to use frequencies that low for. Get used to it, its the way of the future. The latest Prado's are independent suspension all round and that's something else that doesn't bode well for the future of using your 4WD off-road.

Reno,
I do run an engel fridge and that its self is a problem while running. It sounds a bit like crickets in the background.

John,
The noise is rev related and the installers said that the injectors caused it due to the large voltage used (?). By the sound of the replies, I think it a common problem with the new diesels and theres not really much I can do about it.

Will give the tail pipe an earth strap and see how I go.

Regards,
Grey

John Jacobs <john_on_road@...> wrote:
Most of the noise generated in these new vehicles s due to the high pressure diesel pump. Partly the high voltage used and partly the static generated by the diesel fuel as it rushes thro' non-conductive pipes. As the engine block and and exhaust pipe tend to be suspended on rubber mounts, this noise has no earth path and the exhaust pipe acts as an antenna radiating the hash. An earth strap from the tail pipe to the chassis usually reduces this to a manageable level.

At risk of teaching my granny to suck eggs, can I suggest you identify the source of the noise, rather than trying to fix everything. Is the noise worse when rolling or stationary? When standing, does it increase with revs? Once the source is found, the cure is usually easy!

Good luck

John

Hi Grey, I have a 4.2l troopy and most of the noise comes from the oil pressure sender. I've put a switch in so I can switch the sender off when I want to use the radio...
Perhaps unplug the sender and go for a drive to try?

cheers
Glenn

Glen,

Does the noise you suffer from the oil sender vary with Revs at all ? ie above 2000rpm ?---
The oil pressure would be relative to engine speed, I have 60 series and I have an issue
with noise on 14Mhz... I have bonded alternator, bonnet, bullbar etc but the noise is not
so much an issue on the lower frequencies as it was (proir to bonding straps) but above
about 12Mhz it is an issue.. It has me puzzled at the moment This has only been an issue
with the 8558 antenna, I had a tapped whip and 8555 auto tune before that and it was not an
issue.

Glenn <w665@...> wrote:

Paul, yep, after about 1500 - 2000 rpm. At idle not too bad but after that to much noise. When I drive along, with sender switched off it's not too bad, swith the switch and the squelch justs cuts the lot out as noise..

The oil pressure sending gauge was a well known source of strife on the series 60 .I found the best way was to just put a switch to disconnect it at radio times. Also the fan used to cause some noise when it was on high. In those days I'd be mainly on 14 meg so don't know about the lower frequencies.

Cheers
Jim

Thanks very much,

That sounds like the noise...where did you place your switch ?

Glenn <w665@...> wrote:
Paul, yep, after about 1500 - 2000 rpm. At idle not too bad but after that to much noise. When I drive along, with sender switched off it's not too bad, swith the switch and the squelch justs cuts the lot out as noise..

Glenn
--- In codan_outback_radio@yahoogroups.com, Paul <vk2jlx@y...> wrote:
> Glen,
>
> Does the noise you suffer from the oil sender vary with Revs at all ? ie above 2000rpm ?--- The oil pressure would be relative to engine speed, I have 60 series and I have an issue with noise on 14Mhz... I have bonded alternator, bonnet, bullbar etc but the noise is not so much an issue on the lower frequencies as it was (proir to bonding straps) but above about 12Mhz it is an issue.. It has me puzzled at the moment This has only been an issue with the 8558 antenna, I had a tapped whip and 8555 auto tune before that and it was not an issue.

Has anyone tried any suppression methods with the oil sender at all?? A switch may be an option but I would prefer not be without it when I am on the radio..(maybe I am on the radio too much :))

Malcom,

its not independant suspension thats the issue, but rather the implementation of it - some of the offroad desert racers in in USA that AVERAGE over 120MPH for many hours are fully independantly sprung. Wheel travel is well above 24" - closer to 36".

Standard suspension systems just break with that sort of treatment.

"Malcolm at \"On-Track4wd\" in Greymouth" <on-track4wd@...> wrote:

snip snip snip 8x ----------

frequencies that low for. Get used to it, its the way of the future. The latest Prado's are independent suspension all round and that's something else that doesn't bode well for the future of using your 4WD off-road.

Hi Whoever,
Sorry, I missed your point completely. Most of us use pretty near standard 4WD's. Independent suspension gives a far smoother ride on road and 4WD's are designed for 90% of the population. 90 % of the population will never drive their 4WD off road. The vehicle you described are highly modified for the purpose they are designed for which is off road racing. Not many of us are going to go down to a used car yard and buy one of these off the lot then go into the outback to explore with are we???

Speaking of Codan Radios, I have one and looing forward to a trip along the Anne Beadell track in the very near future.

My concern is that I have a an LC100 with 4.5ltr petrol engine.

Only Avgas and Diesel available at Warburton.

What effect does Avgas have on the petrol motor, is it recommended, or not recommended?

I know that Aircraft can use MOGAS that normally takes 100LL.

Any replies mutchly appreciated. I have to take about 4 or 5 Jerries with me????

Regards,

Tony, you will definately need your radio on that track. Sorry no experience with avgas but as you know it's a very long haul. Depending on how much you think you'll use heavily laden in desert conditions I'd be taking the jerries or investing in a long range tank.
Cheers'

Yes, just been reading a little info on it.

I thinks its strange that the don't sell unleaded because of the sniffing, I thought it was because of the lead??? AVGAS has more lead than Super???

Anyway, we are heading upto the Old Ganbarrel then Sandy Blight Junction along the Gary Junction to the Alice. Should be a nice trip.

The ole Codan is the most valuable item in the truck, would be lost without it.

Thanks,

Tony

3090. RE: [codan_outback_radio] Now independant suspension OT

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-07-12 05:40:16 UTC
From: Jim
Topic: 3044 Message: 3090

I'm not sure of the technical aspects but I do understand the communities concerns. Petrol sniffing is endemic in many of those areas, far worse than most of us on the seaboard realize.
Should be a great trip. I was off across the Gary solo this year until my wife became ill. Maybe next year.
Cheers
Jim

Subject: Re: [codan_outback_radio] Now independant suspension OT

Yes, just been reading a little info on it.

I thinks its strange that the don't sell unleaded because of the sniffing, I
thought it was because of the lead??? AVGAS has more lead than Super???

Anyway, we are heading upto the Old Ganbarrel then Sandy Blight Junction along the Gary Junction to the Alice. Should be a nice trip.

The ole Codan is the most valuable item in the truck, would be lost without
it.

Thanks,

Tony

From: Jeff Mead
Topic: 3091 Message: 3091

>>Hi Adrian,
>>Yep, know all about the arguments about taking these vehicles into outback areas. But what can you do??? The vehicles are made for 90% of the population >>and 90% of the population never take their vehicles off-road. Japanese are great at making electronics and all the wixzz bangs are what 90% of the population >>want. And besides I have no doubt the answer in Japan would be 5 meg??? 7 meg??? what the hell are they used for and why on earth would you want to use >>frequencies that low for. Get used to it, its the way of the future. The latest Prado's are independent suspension all round and that's something else that doesn't >>bode well for the future of using your 4WD off-road.
>>Regards,

You have to remember that the new prado's use Mcphersun Struts and not Torsion Bars.
This means that setup correctly they will do 95% of what a rigid will off road with all the benefits on road.
Not such a bad thing eh!!??
PS The Hummer has fully independant suspension, do recken it slows them down!
All this electronic wizzardy might be a pain in the arse but if you spent $80k on a 4by would you want 157kw or 91kw??

Malcolm,

You couldn't be, of course, referring to the original 4WD? You couldn't possibly be trying to convince me the Japs make a 'better' 4WD than the original "Good 'ole Jeep"? ;-)

I recall some bogs along the Quang Tri near Ca Lu that would have sunk a few of those overweight Jap beasts.

But I degress...

Cheers,

Alex - VK1AC

Jim,

Now you should know I drive a Jeep so's I can carry a good sized oak barrel
in the back!
That way I don't have to worry about bottles... just open the spigot.. ;-)

Worse comes to worst, I can always finish off the wine and use the barrel
staves for traction.

Tony,

AVGAS is usable however.....
It is high in lead and will contaminate or render useless things like O2 sensors and catalytic converters. If you have to use it, it is better to use it diluted with ULP than run it straight. The degree to which your vehicle may be affected by the lead is not able to be predicted. (Do you even have cat's?).
I'd discuss the issue with an EXPERIENCED 4WD mechanic, and see if they have any helpful suggestions.

When you get beyond the bitumen, you'll understand why ULP is not available.

Ian B

Yep,
Put the earth strap near the end of the tail pipe.
A cap on the power cable to your injector pump will reduce the noise, but as you can see from the other correspondence, this is a common and hard to cure problem.
Cheers

John

Grey & Kerryn Campbell <kez_grey@...> wrote:
John,
The noise is rev related and the installers said that the injectors caused it due to the large voltage used (?). By the sound of the replies, I think it a common problem with the new diesels and theres not really much I can do about it.

Will give the tail pipe an earth strap and see how I go.

Regards,
Grey

John Jacobs <john_on_road@...> wrote:
Most of the noise generated in these new vehicles s due to the high pressure diesel pump. Partly the high voltage used and partly the static generated by the diesel fuel as it rushes thro' non-conductive pipes. As the engine block and and exhaust pipe tend to be suspended on rubber mounts, this noise has no earth path and the exhaust pipe acts as an antenna radiating the hash. An earth strap from the tail pipe to the chassis usually reduces this to a manageable level.

At risk of teaching my granny to suck eggs, can I suggest you identify the source of the noise, rather than trying to fix everything. Is the noise worse when rolling or stationary? When standing, does it increase with revs? Once the source is found, the cure is usually easy!

Good luck

John

Tony,
The longest stretch without fuel is 1350km. Given you are on a sandy track and 4WDing you can multiple fuel consumption by 1.5 or 2 (especially in a petrol). My suggestion would be Jerrys. Outback fuel can be a bit dodgy if stored for a long time (petrol is the most vulnerable to containmination). Our cruiser (turbo diesel) runs at 15.5l/100km offroad fully loaded. This means we will have to carry 220litres. In all thats only 4 jerrys. We plan to take the trip early next year.
Grey

Tony Linford <tlinford@...> wrote:
Speaking of Codan Radios, I have one and looing forward to a trip along the Anne Beadell track in the very near future.

My concern is that I have a an LC100 with 4.5ltr petrol engine.

Only Avgas and Diesel available at Warburton.

What effect does Avgas have on the petrol motor, is it recommended, or not recommended?

I know that Aircraft can use MOGAS that normally takes 100LL.

Any replies mutchly appreciated. I have to take about 4 or 5 Jerries with me????

Regards,

And of course Patrols dont have their problems... except for the extra fan fitted on A/C models, the windscreen wipers and so on.....

Its a fact of life, all cars will produce RFI of some type. Some are worse than others.

Tony
Avgas is a high octane fuel. It contains lots of lead to give a RON of 100. Think of it as leaded premium. The cruiser will run OK on it for a while, until the oxygen sensor gets poisened by the lead. Once that happens the ECU will be getting the wrong signals and not be able to regulate the fuel mixture correctly. It may run lean, or rich. Rich isnt so much of a problem, it just fouls plugs. Lean means melted pistons....
I would hope that the ECU is designed to err on the side of rich when in fault condition, Toyota may be able to tell you. The catalytic converter will also be ruined. This wont affect performance, just emissions.
Trouble is cats can be $1000 or more to replace. They are supposed to be checked at rego but ive never really seen it enforced (like tinted windows!!)
Legally speaking Avgas is banned for use on road in Australia, only being sold to airplanes and motorsport users (and trust me its getting real hard to buy it even for motorsport now) . I doubt that would be of any concern to anyone at Warburton!!
I really wouldnt like to take the punt and stick avgas in the cruiser unless you are prepared for a huge repair bill. It would be better to plan your trip around where you can buy fuel, or carry it with you. But thats another tin of worms. Petrol isnt very safe to cart in large quantitys and Im pretty sure for more than 20 litres you need a dangerous goods licence!

cheers
ben

Tony,

AVGAS is usable however.....
It is high in lead and will contaminate or render useless things like O2 sensors and catalytic converters. If you have to use it, it is better to use it diluted with ULP than run it straight. The degree to which your vehicle may be affected by the lead is not able to be predicted. (Do you even have cat's?).
I'd discuss the issue with an EXPERIENCED 4WD mechanic, and see if they have any helpful suggestions.

When you get beyond the bitumen, you'll understand why ULP is not available.

3105. Re: avgas

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-07-28 00:40:16 UTC
From: desertdust
Topic: 3101 Message: 3105

Sorry this is rather long but it clears up the issue about carrying petrol in jerrys

WHAT IS THE LAW?

WESTERN AUSTRALIA
The WA Dangerous Goods Act 1988, and Dangerous Goods (Transport) (Road and Rail) Regulations
1999, contains the relevant regulations, both of which are based on the Australian Dangerous
Goods Code (ADGC), sixth edition.

The maximum permissible quantity is 250 litres of petrol, which should be carried in approved
containers in either the boot or on external brackets. It can be carried within the passenger
compartment, such as the back of a station wagon, in approved, properly restrained containers,
but this is not recommended.
Contact the Explosives and Dangerous Goods Division of the WA Department of Mineral and
Petroleum Resources for further into (08 9222 333)

QUEENSLAND
The Transport Operations (Road Use Management - Dangerous Goods) Regulation 1998 permits
carrying up to 250 litres of dangerous goods (fuel) for personal use. The responsibility for
filling a JERRY can and ensuring it is an approved container lies with the person filling the
container.

Under the Transport Operations (Road Use Management) Act 1995 owners are prohibited from
modifying their vehicle, its parts or equipment, and from carrying dangerous goods
(irrespective of quantity or position), in an unsafe manner.

This includes carrying containers upright, ensuring they don't leak and are properly secured,
and do not overload the vehicle (especially if transported on roof-racks). A booklet titled Load
Restraint Guide (available from Commonwealth Government Bookshops) should be consulted
Write to: Greg Swann, Group Manager, Vehicle Safety and Industry Reform Section,

Queensland Transport, PO Box 673 Fortitude Valley QLD 4006.

SOUTH AUSTRALIA
In South Australia, petrol is covered by the Dangerous Substances Act and Regulations, which are
in turn based on the ADGC; therefore, the same 250- limit applies.

Diesel is unregulated, as elsewhere, but the Department for Administrative and Information
Services advises that petrol (and diesel) transportation would be covered by the general duty of
care provisions contained in Sections 11 and 12 of the Dangerous Substances Act.

The Road Traffic Act has provisions for duly of care relating to vehicle safety issues such as
overhanging loads and impact protection. They also state that, while carrying fuel in the
driver's vapour space (in a van or wagon), is much debated, it is up to each individual driver
to assess their own risk and duty of care provisions when deciding whether to fit a range tank
or carry fuel in JERRY CANS. Dangerous Substances Branch, Workplace Services (08) 8303 0447

VICTORIA
In Victoria, the relevant legislation is the Road Act 1995, which has been adopted from
the, (Dangerous Goods) Act -1995 and the Road Transport (Dangerous Goods) Regulations.

The Regulations reference the ADGC under which Regulation 1.10 exempts small quantities of fuel
from the rigours of the Dangerous Goods legislation. This refers, again, to petrol only. Diesel
is not considered dangerous goods.

They maintain it is the responsibility of the driver items, regardless of type, are firmly and
a fuel should be stored in AS2906 containers minimum requirement.
Write to: Victorian WorkCover Authority, Dangerous Goods Unit
GPO Box 4306 Melbourne Vic 3001

TASMANIA
The Tasmanian government refers these, issues to the Dangerous Goods (Road and Rail Transport)
Regulations 1998, which covers general safety and load restraint safety.

The filling of fuel containers is also covered by AS1940 - Storage and Handling of Combustible
and Flammable Liquids. They advise that a person can carry 250 litres

of petrol for private use
(as per the ADOC), but the containers must meet AS2906 Fuel
Containers/Portable/Plastics and
Metal.

Tasmanian Vehicle and Traffic (Vehicle Standards) that an object
fitted to a vehicle must be
designed, built and maintained to minimise the likelihood of injury.
As such, this would
prohibit the fitting of JERRY CANS containing dangerous or explosive
substances to any vehicle
(car,4WD, caravan, trailer), especially given the likelihood of rear
or side-impact collisions.

Owners of vehicles should check the 'fine print' of their insurance
policies. If fuel is
transported in an unsafe manner and an accident leads to greater
damage or injury than might
otherwise have been the case apportion blame to the driver and/or
invalidate the policy.
Write to: The Department of Infrastructure, Energy and Resources,
GPO BOX 936 HOBART TAS 7001.

NEW SOUTH WALES
The NSW Environment Protection Authority (EPA) and WorkCover NSW are
the competent authorities
for dangerous goods control in NSW. They' administer the Road and
Rail Transport (Dangerous
Goods) Act 1997 and the Road Transport Reform (Dangerous Goods) (NSW)
Regulations 1998.

Under these laws, JERRY CANS must be approved containers for the
transport of Class 3 liquids
(petrol) (ie, AS2906) and the maximum permissible quantity is 250
litres. Diesel is not
considered a dangerous good, but a combustible, and must be carried
in a safe manner.

Division 9.3.1 (1) (e) of the ADGC states that 'if the package (ie,
JERRY can) contains
dangerous goods of a kind that may lead to the formation of
flammable, toxic or other harmful
atmospheres - the package must be stowed so that no harmful
atmosphere will accumulate in the
cabin If the package leaks'.

The above would indicate that great care should be taken when storing
JERRY CANS inside a 4WD's
luggage compartment, whether it is a separate boot or part of the
passenger compartment. AS2906
containers are designed not to vent to the atmosphere, provided they
are in good condition and

the seals/lids are functioning correctly.

Write to: NSW Environment Protection Authority
Dangerous Goods Office
59-61 Goulburn St, Sydney NSW 2000.

NORTHERN TERRITORY.
Only containers which comply with Northern Territory Dangerous Goods Regulation 217 can be used
to transport flammable, (petrol.) and combustible (diesel) fuels. Essentially, this covers
containers complying with AS1533/34 and AS1 940, but 'approved container' is also specified
which indicates that containers complying with AS2906 would also be acceptable.

The Northern Territory Dangerous Goods legislation is b ADGC, which specifies that not more
than 250 litres of petrol can be carried. No quantity is specified for diesel.

Information bulletins are available at www.nt.gov.au/cbb/wha or contact
The Department of Industries and Business, Work Health (08) 8999 511 8

AUSTRALIAN CAPITAL TERRITORY
The transport of fuel is covered under the Dangerous Goods Act. 1975, Dangerous, Goods
Regulations 1978, Road Transport Reform (Dangerous Goods) Act 1995 and Road Transport
(Dangerous Goods) Regulations. The latter takes its requirements from the ADGC.

The DGA (1975) Section, 12 and 14 require fuel to be carried in appropriate, containers
to prevent spillage or leakage, and make it an offence to carry fuel in a manner likely to
cause death/injury, or damage to property.

Section 37(1) of the RTR (DIG) Act1 1995 requires fuel be transported in a safe manner.
Sub Section (2) makes it an offence to do so where a person "ought to have known" that what
they were doing was unsafe or likely to cause damage to persons or property.
Contact: ACT WorkCover (Dangerous Goods) (02) 6207 6354.

Tony, there are several other parties on the Anne Beadell or about to go.
One I know of is a standard 100 series diesel that will be carrying 4
jerries (and a Codan radio that I know rather well:) They are also planning
on doing the Canning. I'd assume they have organized a fuel dump out of
Capricorn Roadhouse also.
Cheers
Jim

Grey,

Some time ago I did a little research on this issue and came up with a few tips and tricks, but these websites should give you the information you need, should you wish to go to the lenghths required to minimise RFI.

http://www.k2bj.com/Pages/Noise/Intro.htm
http://www.realhamradio.com/RFI_Solutions.htm
http://www.eham.net/articles/4623
http://www.qsl.net/ka0dxm/hfnoise.html
http://www.mtm-int.com/products/knowhow_capacitors.htm
http://members.cox.net/nx7u/mobile/noise.htm

Some of these links are more useful than others, but it is a start point for you.

Godd luck with it...

Mark

Just re-installed my Codan model 8528 with 8533 head and unfortunately it's not tuning.

There are obviously many symptoms to this problem, but what have people experienced as easy solutions?

One of them is the earth, I have a large earth strap it's just a matter of finding a good place to put it.

The other thing is that my antenna is placed on the spare wheel carrier, and I know the model autotune model 8558 prefers to be on the front bullbar??
Any solutions?

regards,

Tony

> Tony
> Avgas is a high octane fuel. It contains lots of lead to give a RON of
> 100. Think of it as leaded premium.

There are various grades of AVGAS, though some are either missing completely or
very hard to get. 80 (red dye) is mostly extinct. Straight 100 (Green)
is getting hard to find. 100LL (low lead - blue) is the commonest and is being touted
as a (mostly) acceptable replacement for the other two.
There is another grade, 130/145 (I think - Clear - I think) that is used by some high
performance/compression
radials and similar.
The RAAF use it for the Caribous. One of the reasons they wanted
to replace them with a more recent aircraft is that finding the high octane AVGAS for their
radial engines was becoming both difficult and unreasonably expensive.

100LL (Low Lead) is the commonest type. It would be
ok in just about any pre 87 vehicle (like my indestructible 1977 G60 Patrol ;^)
Obligatory On Topic: It has a Codan 7727 Remote Head radio fitted, though I don't
have a suitable (ie cheap enough) antenna for it yet. Still looking, but might roll my
own multi-tap I think - all the commercial stuff seems *way* overpriced to me.

Like you said, it's not a real good idea with modern vehicles since
ANY tetraethyl lead in the fuel will 'poison' the cat converter
and will ultimately cause problems with sensors and sometimes injectors
in the electronically controlled injected vehicles.

I'm not sure if there is a lead free AVGAS yet, but given that GA aircraft engine design
hasn't altered much over the last 20 years or so, probably not.

The cost is another factor, AVGAS is rather more expensive than any form of MOGAS.

Just re-installed my Codan model 8528 with 8533 head and unfortunately
it's
not tuning.

<Shnip>
Tony when you mention 8558's there are few easy solutions. I'd check the
AD card after tuning as a start (check the archives) , the fault may not be
in the aerial.
As you mention many faults are due to lack of earthing. Is it tuning at
any frequency or just refusing to tune at all? Try a high (14977?)
frequency, it should tune ok even if the earth isnt that great. As you go
lower than around 11 meg it will refuse to tune if its an earth problem.
If thats not the case I'd be looking at Bens page for help dismantling it.
Cheers
Jim

Thanks Jim

Just connected the earth strap which is actually made up battery lead, thick
cable.

It tuned on 4 khz channel but nothing else, at least it tuned on something,
a good start.

Regards,

Tony

If you can get hold of a multimeter, measure between the aerial socket
outside and the vehicle earth. It should be as low a reading as possible.
While you're at it, check the aerial cable and the sets earth. Make sure
that the aerial is earthed from the uppermost aluminuim support bracket on
the 8558 base.
Cheers
Jim

Hi Jim ;-)

Yes, we have 2 sleeps until we go.
We should be leaving Cooper Pedy on Thursday 5th August, with 4 100 series landcruisers.
All standard 150L tanks, and all diesels.
As Jim said, we all have 4 jerries of diesel strapped in the original position of the backseat.
So if you see a convoy of 4 100 series with QLD plates, give us a yell :-)

Cheers,

Stefan.

3116. Re: [codan_outback_radio] New Member - NGT

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-07-28 10:39:47 UTC
From: Sam Point
Topic: 3044 Message: 3116

Hi Grey. Well we haven't any Turbo 100 series, only Turbo Troopies and haven't had any troubles so far. Must be my superior installs :-). Anyway, the NGT's installed seem to enjoy being well earthed. In the install kit you get 3 earth leads:
2 X 10mm by 300mm plated braid leads in heatshrink tubing with M10 crimp lugs.
1 X 30mm by 600mm plated braid lead with M12 crimp lugs. This lead is the same type as the earth lead on the 9350 antenna.

I have found it is better to use the large lead as an earth lead from the NGT to the nearest body earth point, generally this is an existing Manufacturers fixed threaded nut in the body, ie: the tie down "D's" under the back seat in a LC100 or similar in the 78.
All radio's are mounted to steel mounting plates on the passenger side of the car that are also earthed to the body.
The earth lead from the 9350 antenna is run through the radiator shroud and earthed in 2 places (New Codan earth leads have 2 earthing points!), the first one is under the battery tie down bolt on the Radiator support frame. This is prepared, once the battery tie down is removed, by using a bastard file to remove all surface coating down to bare metal for a distance of 30mm all around the bolt hole then sprayed with either "Electrolube contact cleaner and lubricant" or "Electrolube anti humidity protectant/lubricant" then the carrier is placed over the 1st hole in the earth lead (Flat side of earth point down.) and a Stainless steel washer between the carrier and earth lead and tightened down.
The 2nd hole at the end is then routed around the battery and taken to the chassis earth point just behind the battery. Just one s/s washer is used here
between the earth lead and bolt head.
This seems to work on normal LC100's and Turbo 78's at the moment but these installs are mainlt 9323 radios but I did fit a LC100 last week with
an NGT and conducted radio checks on various frequencies (3 mhz, 6 mhz and 10 mhz.) with sites between 20klms to over 1500 klms with selcall and easitalk on and off. All checks fine except for slow operator at one station.
All cables run down beside the main loom on the passenger side except the control head lead which goes down the transmission hump to the dashboard.
Cables through the firewall go through the rubber boot found behind the glovebox and above the aircon unit. i have found this the easiest way in LC100's and
seems to also suffer from less interferance.

We have over 30 LC100's fitted as well as 12 troopies and Hiluxes. The Hiluxes used to be the worst for interferance with the petrol 4 cylinder motor.

My 2 cent's worth.
Sam

Stefan,

We might see you there.

We leave Melbourne on the 1st and head out from Coober around the 4th. You just never know.

We have 1 LC100 a Prado and a nissan tray for something different.

Enjoy the trip.

Tony

That's where I could be going wrong.

The actual set has no earth whatsoever.

It is tuning to the lower freq. VKS737 channels 1 and 5.

but nothing else.

Regards,

Tony

Tony, earth the set to the vehicle as a matter of good practise. It may not
cure your problems but it won't hurt. What frequencies isn't it tuning to ?
Is there a band of frequencies, say 4-8 meg that it won't tune to ?
Cheers
Jim

3125. RE: [codan_outback_radio] Was Re: New Member - NGT now 8558 problems.

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-07-29 00:21:21 UTC
From: Jim
Topic: 3044 Message: 3125

Its worth trying but unless the earthing is better then it may not improve
things. To give you some idea, with an 8558 leaning against a brick wall,
concrete floor , tunes 11 meg up. Connect earth and tunes everything except
11612. On bullbar earthed correctly it tunes all frequencies.
Thats just one aerial, others are different.
Have you tried changing the impedance tap inside the aerial ?
Cheers
Jim

No I haven't changed the impedance tap.

Is that explained in Bens website and what does it do??

Tony

3128. RE: [codan_outback_radio] Was Re: New Member - NGT now 8558 problems.

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-07-29 00:35:33 UTC
From: Jim
Topic: 3044 Message: 3128

Ok. Be careful with it, only one person I know will fix them.....and I
hate doing it :)))

Cheers
Jim

Not sure if the NGT has a serial control port, i doubt it has TCP/IP
connetivity, assuming the NGT has serial control a possible way to
control would be via a ISDN terminal addaptor with one channel for
the audio path and second channel for the serial port, but the best
would be to contact codan tech support and ask about remote control
options and type of links supported.
maybe a voice link over IP might be a option.
also a peek in the codan web site applications might offer some clues

ciao

Franco

3134. NGT Remote control

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-07-30 07:12:23 UTC
From: mdolci@sfera.net
Topic: 3132 Message: 3134

Thanks a lot Franco for your message.
Our system includes: NGT Console+3030 NRI+Cisco Router in the main office and Cisco router+ 3030 NRI+ NGT 2010 RF unit in the remote site.
According to Codan, the system works using two modems instead of the routers,but a dedicated two wires phone line is required.
Therefore, audio+ contols seem to be on the same channel.
The problem we see is that audio signal is intermittent.
Bst regards.
Michele

Hello Peter
I think you better go back to the Price Book as the NGT AR Voice Radio has a Yellow Face on it is NOT $1400 Dollars

The Only Differance is the New NGT does not have the Junction BOX as you have stated but you can have GPS option with out the Junction Box.

Also the Codan 8525 and 8528 can have Option PS the Gives you full data in and out of both of these radios with out hacking up any parts of the Radio.

Peter Cattell <cattellp@...> wrote:
Ahhh! One of the few Codan things I may know more about than you
Jim! Yes, last December Codan increased the RRP of the NGT AR from $4100
to $4900 (of course no one buys at the RRP). At the same time they
brought out the AR Voice model at $1400. Main obvious difference is no jn
box and correspondingly no data capability. So net affect is no real
difference to the average au 4WD user as most did not want data when the
Codan modem was about $3K anyway. Also, BTW the long awaited A option for
he NGT should be out in a few weeks (but its been a few weeks since last
Christmas),

Peter

Hello Frank
Yes there is Remote control for the NGT Series of Radios.

The Line Gear is only 20Km in length for the remote site
I have just install the 5th Lot here in Australia.

Peter,

Knowledge please.

With the 828, are you saying data can be sent without modification.

What type of data can be sent ie please provide examples - eg GPS data,
coms from computer etc

Sorry to be vague, but this is vague to me but I can see potential for
better coms with back home if certain data can be sent efficiently

Steve

Subject: Re: [codan_outback_radio] NGT

Hello Peter
I think you better go back to the Price Book as the NGT AR Voice Radio
has a Yellow Face on it is NOT $1400 Dollars

The Only Differance is the New NGT does not have the Junction BOX as you
have stated but you can have GPS option with out the Junction Box.

Also the Codan 8525 and 8528 can have Option PS the Gives you full data
in and out of both of these radios with out hacking up any parts of the
Radio.

Ahhh! One of the few Codan things I may know more about than you
Jim! Yes, last December Codan increased the RRP of the NGT AR from
$4100
to $4900 (of course no one buys at the RRP). At the same time they
brought out the AR Voice model at $1400. Main obvious difference is no
jn
box and correspondingly no data capability. So net affect is no real
difference to the average au 4WD user as most did not want data when the

Codan modem was about $3K anyway. Also, BTW the long awaited A option
for
he NGT should be out in a few weeks (but its been a few weeks since last

Christmas),

Peter

Peter,
may I ask you what type of phone line did you use?
We have to use ISDN, but Codan specs require 2-wire leased line. Of course we tried to connect with our ISDN, but it doesnt work.
We replaced the original modems with two routers,but the audio is instable. The solution suggested by Frank to split audio and serial port is fine. But we have one ISDN line only available and, in addition to that, I guess that we have to modify some circuits .

Regards and thanks.

Looking at the codan web site regarding NGT remote control, it says it uses a 4 wire leased line and voice frequency modems within the codan remote units , assuming the router can provied a 64k PCM speech channel or 32k ADPCM speech channel, the modems should work with in specs over a voice link via routers, the codan web site says it will work over a "voice channel" also says the modan standard used is a V32 so assuming your using a good voice circuit over the routers,it should work.

Regards
Frank

3141. TX on Free Tune Reciever on 9323

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-08-03 04:38:11 UTC
From: Graeme and Lillian
Topic: 3141 Message: 3141

In free tune mode on the 9323 it looks great in terms of amateur radio operation but is it possible to also by pass the PTT inhibit mode for TX in the amateur radio bands only.

Graeme

3142. Interferance from 100 Series and Discovery

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-08-03 10:56:39 UTC
From: Peter Brennan
Topic: 3142 Message: 3142

Hello All
The New 100 Series from 2002 and the Discovery Series from 2001
Will suffer from Interferance due to the Engine Management system under the Bonet.

This has been a Issue the I have spoken to Codan about and the UN Services also have the same PROBLEM which is BIG as well.

The New Engine Management system has a High Feild around this device, and Even if Powering the Radio from a Seperate Power source it will be there still.

You will not be able to Have the Motor running and Listening to the Radio on the Move due to the Feild from the Motor Compartment.

The New Nissan is now also having the Same Problem as well as the Have now changed there Engine Computer Management system as well now.

Turn off the Motor and it all go's away, you will hear it as soon as you warm the Fuel up in the Injectors.

Topic: 3141 Message: 3144

Graeme,

The easiest answer is probably NO. To say that Free Tune TX is not available.

The long answer to this is YES. Free Tune TX is possible, but the restrictions seem to be very stringent. If you find you can get it done it will no doubt cost you another load of money for Codan to release the code to an authorised agent so they can program it into your radio. Codan did tell me (years ago) if I could produce my Amateur licence to them (or an authorised agent), they could arrange for the free tune TX. However I'm not sure if they have changed their tone on that matter since. There are very few 9323's out there with this function. I think there were a small number of these released to a couple of Government Agencies, but that was about it.

Brian.

3145. TX on Free Tune Receiver on 9323

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-08-03 23:35:20 UTC
From: Richter, Mike W
Topic: 3145 Message: 3145

FreeTune Tx is what Amateur Transceivers have - you tune around in VFO mode and transmit anywhere in Amateur Bands.

This is NOT what Option TXE in a 9323 offers - what it allows is that you can program a frequency into Memory from FreeTune. Not very practical for Amateur use though - you tune on a station you want to transmit to, then you have to go through the dozen key presses to save the frequency to memory.

FreeTune TX within Amateur Bands has never been available for the 9323.

The only advantage that Option TXE has over the Save to memory mode in a normal 9323 is that you save to memory without going through power-off, power-on.

The quickest way to transmit on amateur frequencies on a 9323 is to use the "Emergency Call" shortcut that is on the website. A nuisance, but it's ok.

I have designed some modifications which would allow FreeTune Tx in a 9323, but I don't have any time to test if it really works.

Hi Paul, thanks for that. I knew the Russian bases used the Barrett 1kw jobs, maybe they just transferred em across :)) The Collins HF8022 were 10Kw tx's I think.
The use of 8528's means that they must have some bits for spares, interesting as Codan don't.
Apologies for the link. Try this for Davis station

3149. Amateur Transmit on 9323

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-08-04 06:22:18 UTC
From: Richter, Mike W
Topic: 3149 Message: 3149

For Amateurs, there are two ways on a 9323 of transmitting on frequencies that aren't currently programmed in memory.

Both methods are detailed on http://ozradio.wireless.org.au/9323.htm

A. Create a new Transmit frequency in Memory
1. Write down the frequency, Turn off power
2. Close TPE link
3. Turn on Radio and wait for startup
4. Program frequency and additional info (you can't transmit in this mode)
5. Turn off power
6. Open TPE link
7. Turn on Radio and wait for startup
8. Transmit(LSB is not available)
(If TXE is enabled this eliminates all steps 4)

B. Emergency from Free-Tune
1. From FreeTune, Program frequency as Receive only
2. Go to FreeTune mode
3. Press EMGCY
4. Change to Memory Mode
5. Transmit, hoping the caller is still listening on that frequency
- LSB is available
- Selcall and Tone call are NOT available

Mike VK2BMM R14

Thanks a good price, since the unit is only about 2yrs old, with little to no use in the last 9 months.

3157. Codan 8528 option TXE help please

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-08-06 09:10:06 UTC
From: ffr58kk90
Topic: 3157 Message: 3157

Hi
I have a couple of Codan 8528's that I use on the amateur bands in England.
Anyone have any information on the 'TXE' option eprom, it appears that it will allow me to dial in a frequency and then transmit anywhere on the band.
If so, then this would be ideal for the 5mhz frequencies that I have access to.
Both my current radio's have the TXA option and I find that not being able to dial in the frequency and tx without programming P channels makes life a tad difficult when working 5mhz stations.
If anyone has a romfile that I could try, it would be appreciated.

Regards

Tony Steele

3158. NGT JUNCTION BOX

Soem emails last week spoke of the junction box thing that you can get to use with the voice only version of the NGT. What is the prupose of the junction box given the basic NGT can do GPS (if it is programmed) I assume there must be some other uses for this box.

A question for the installers out there - where have you mounted the handset for the NGT in the 100 series Standard L/Cruiser.
My mate has picked one up & brought it around seeking help to install it - I reckon the 9323 remote head was easier to fit.

Tony,

The TXE option only means that you do not have to short the TPE link and go through the 'switch off/switch on' sequence. It will not allow you to transmit freely accross the bands in the same way that Option A does on the Amateur Bands. It probably won't solve your frustration.

For more information, go to Ben's website, the link to which can be found in various previous posts or in the 'links' section on the yahoo groups website.

Sorry I could not be more help.

Cheers,

Mark

Hello everybody,

i need help to program a new EPROM for a Codan TX, type 8525.

-first, i don't know if my 8525 is a A or a B version. Nothing is written on the casing. The only thing i can say, this is the number written on the EPROM : 90-20133
Can somebody help me ?

- second : i don't know how to make an EPROM profile. If i send the frequency list i wish, can somebody make the .BIN file and send it to me ?

I thank you for your help.

HI

Remove the biggest cover of the radio and look at the microprocessor board.
This is where the eprom you described is.

Right at the bottom of the board should be two little 8 pin chips type
number PCF8582 next to each other. This is a B type board, so your radio
is a 8525B

The other way is to look at the amplifier board and you will see large
coils "looks like donuts" there should be 12 of them to be a B type.

73's Adrian VK5ZBR

It has big coils in it that look like donuts

Graham, I looked around for schematics of early Codan tuners and found nothing. I was forced to trace the circuitry, Not difficult unless it's missing something ? Mine had been rewired. The new wiring defied logic, so I just wired it back to work. Ergo, one nice little tuner for long wires.

Hi

I have recently acquired a CODAN 7113 Power Supply and I would like to power my 8528 as a base station and also float a back-up battery. The unit has 2 multi pin connectors on rear, one male the other female. Does anyone know which connector connects to the battery and which can power the 8528 direct. A look inside reveals the same size wiring running through a relay which is activated when the unit is powered up..

Thanks in advance.

Larry

Hi Larry,
From memory the lower connector is the battery and the upper is the radio. When power is on the set holds the relay on and charges the battery. When power is off the relay changes over and delivers the 12 volts from the battery to the radio thru the bottom connector, thru the relay and out the top connector.
Personally I think this is a crap arrangement as for my money it is much preferable to power the radio from the battery all the time and charge the battery from the power supply. This way there can be no loss of current to the radio when in hi peak modulation situations.

Hope that helps.

From: Malcolm at "On-Track4wd" in Greymouth
Topic: 3172 Message: 3178

Larry,
Other thing to check is that the output to the battery is actually 13.8 volts. I have found that they can be anything up to 15 volts as they are powered parallel and regulated separately from the main supply. This can cause batteries to boil away if they have no load on them. The 7113 does the job well for running a radio but the charging system leaves a lot to be desired.
I prefer to connect the battery and the set together, let the main supply charge the batter and run the radio at the same time. Other problem with the relay change over is that the mains voltage has to drop away before the relay will drop out, this will cause a momentary loss of power to the radio which will un mute the sellcall while the radio re[powers up etc which can be annoying.
Regards,

Malcolm Langley.

Well your right there Malcolm - this one is outputing 16.2v at the Battery charge and a more realistic 13.6V at the main output. I will definitely connect the radio to the battery bank and let the PSU float the battery.

Cheers Larry

> Larry,
> Other thing to check is that the output to the battery is actually 13.8 volts. I have found that they can be anything up to 15 volts as they are powered parallel and regulated separately from the main supply. This can cause batteries to boil away if they have no load on them. The 7113 does the job well for running a radio but the charging system leaves a lot to be desired.
> I prefer to connect the battery and the set together, let the main supply charge the batter and run the radio at the same time. Other problem with the relay change over is that the mains voltage has to drop away before the relay will drop out, this will cause a momentary loss of power to the radio which will un mute the sellcall while the radio re[powers up etc which can be annoying.

Hello,

on mine which i have tested yesterday evening, the lower plug (female) is
for the transceiver.
The upper plug (male) is for the battery.

Best regards, St?phane F1SRX.

That is correct. I have a schematic I drew up back in '91. I'd upload it BUT it is in OrcadSDT(DOS) format, and I haven't found any way to output except to a printer under DOS which I can't capture. If anyone has a way ...

Could do a print->scan I suppose. Any interest?

Peter

P.S. On my bench I run a small short-proof 1A PSU on the battery port. Only when I need grunt do I flick the 7113 on. That way only SMALL clouds of smoke are emitted from my "test area".

If it's not too much hassle a circuit would be great. I'm often asked similar questions about the 7113. In fact I use a 7113B here but its been modded with no trickle output and giant banana sockets on the back.
I really need short circuit and overvoltage protection on its output but havent found time to make a board up yet.
Cheers

Tony,

I have had my NGT handset install on the lefthand side of the dashboard. It is just below the air vent opposite to the hazard button. The part of the das that the craddle screws into is replaceable therefore no longterm damage. It is easy to reach and see.
Regards
Grey

Graeme,

is this installed base or mobile? Best thing is to put on a dummy load as the Codan drops the power if the VSWR is bad. You can chop the system into two halves by pressing the Tune button. If you get o/p from the Tune, the all the RF side and PA is OK. After that, well...its trace the signal and see where it stops time.

Good luck

John

Hi Graeme

Does your radio put out power when you selcall or hold the tune button down?

By this I mean does the bar graph show power.

If not your Mic element is open circuit, this is a common fault with codan mics.

Deary me there Jim - how about the RD contest. I have been playing around and am around the 25 mark - very much playing and not persuing it seriously - although I have to get up in 4 hours to drive to the NSW central coast, so I really should get my head down before I leave.
On a different topic, do you still need a copy of the Radphone 2000 interconnect manual? Cleaning up some junk I found a copy that I had lying around - do you still want it or have you obtained from another source?
I will be bcak on Monday night - or possibly Tuesday, so let me know and I will action on my return (assuming that you want it).

Michele, Codan do a version of the NGT remote that works on "E' and "M" lines, this one can be run over microwave and Fiber
optic systems.
We use a similar system in our department for our long distance UHF remote sites, 12 sites over 1000 klm. They also do a version for use over VHF or UHF radio links (Duplex). Have a look at the Codan site and the PDF files on remote controls.

Michele,

You are really pushing the stuff uphill with a pointed stick.
Routers use IP which is a packet protocol. The Codan CIB uses a variable speed streaming protocol at max 19k2.
Thus, the two systems are essentially incompatible.

Good luck

John

what interface is the 4 wire E&M interface called can it connect to
the codan interface bus, also does the E&M interface use in band or
out band signalling, does it still use a modem over a audio link for
the audio path and control.

Most routers support a 2/4 wire E&M interface or use a Voip bos with
E&M ports.

I sounds to me codan is very to its own and dont really give much
open standards interconnect.

Regards

E&M (ear & mouth) provides both the audio ccts and signalling ccts. The signalling relates to establishing, maintaining & clearing the call. The audio is the speak/audio signal being tx / rx.

There are FIVE (5) E&M configurations, and you need to establish which type is used as they are not really intrchangable.

Keep in mind that while a router can have have FXO/FXS ports (using E&M signalling), you will need to use G729 voice digitisation (G711 as used by telco's uses 64K plus packet overhead) across a guarranteed ISDN channel.

G729 will not be good for (computer type) modem use. Best to send any data on a seperate B channel and pull it out at each end. IF its low speed data (1200bps or less) you MAY get away with digitising it - test in a lab first before committing.

Well the washing up's finished, plenty of wood on the fire and everyone else is inside the tent. Free tuning the Codan receiver gets you country music and lots of whistles and squarks. You're not in the mood to use your amateur frequencies, so what to do ?
Lots of interesting frequencies to check out here
http://www.geocities.com/CapeCanaveral/Launchpad/7769/australia.html

Cheers
Jim

You are spot on John.
The 2 protols are mostly incompatable. Another thing to consider is the CIB is not simply audio + control. There are many audio channels, 5 or 7 I think. TDMed running between the radio and junction box. I can't recall all but it's sort of like muted audio, unmuted audio, volume controlled audio, straight audio, maybe separate tx audio.

The Codan remote control is designed just to extend the CIB over a pair of wires (or 4 wire cct)using industrial modems.
To have a robust reliable remote operation it is necessary to use industrial modems and therefore the rest of the equipment must be tailored to suit.

If you wish to go outside of this and retain reliable operation maybe look at the split site facility that Codan offer. This can be configured so it just extends the audio and signalling and (I won't stick my neck out too much here) should adapt to most E&M mux systems. It's not an extension of the the CIB, just an extension on the audio and signalling.

regards Rodney

I am not sure if I fully understand what you are trying to do BUT

I am a control systems programmer, and I was planing to write some code for an AMX controler to drive the NGT, I am not sure what functions you would require, and what feedback?
If I was to do it on a NetLinx platform, it would have a simple web interface, and you would just need an audio link to hear and talk to the radio.

If this sounds interesting let me know and I will try it soon.

The Netlinx system is about $3-4000, + programming, not sure if this is too pricey? There is a new cheaper one coming soon, but I have not seen it yet.

Hi All
I am currently in the market for a new NGT and my question's pertain to the installation of same in my 2003 RV Troopy.

I am intending to do the installation myself and am interested in any info and advice that you may be able to provide in this regard.

I have good mechanical and electrical skills so don't anticipate any real dramas.

I have been advised to ensure that ALL components are well earthed, any advice in this or any other matter would be welcome.
Is the installation detail provided by Codan with the unit well written and clearly explained ?
I am intending to fit the Auto Tune to the rear wheel carrier with a Kaymar mount at this stage.

Many thanks for your time. and I look forward to any advice in this regard.

Regards
John

I too am only new here, but there are some good ideas in the photo section here.

I put mine on the cargo barrier in my 80 Series Cruiser, and made my own mount for the antenna on the Kaymar rear wheel carrier.
Make sure your mount is strong enough for the 4WDing you may do, My mount is quite simply a piece of 100 x 100 x 10mm steel angle secured to one of the big bolts that allow you to adjust the wheel hub mount. I will try to add some pictures latter.

might also be a good idea to read Codans paper on the merits of rear verses front mounting(in the files section here), but if you , like me plan to travel through Victoria and maybe other states too, front mounting is not a legal option.

Good luck with it, they seem like a great radio, I just have to learn how to drive all its features.

From: troopy_john
Topic: 3212 Message: 3212

I have to say thats it is quite interesting to listen to how little
some Codan dealers seem to know about there product.

I asked the question about which model they were offering to me, be
it the ASR, AR-Voice,SR or the VR.

I have been told by three different dealers three different models.
E.g One said the VR as this was the only model sold in Aus.
Another said the ASR as this was the only model available in Aus.
And yet another said the AR as this was the only model in Aus.

So I rang Codan in SA and a very nice gentleman, who was very good
to deal with said that at the price they are quoting. They were
quoting on the AR-Voice and that it and the ASR are the only two
models sold in Australia in normal usage.

The AR having a yellow colored label system the ASR having a
Blue/Grey label system.
He said that they sell about 100 to 1 of the AR Vs the ASR.

So what model do you all have is the question ?

Regards

John

John, understandable that they don't know much unless its a major part of their income. What would concern me is why they didn't say "I don't know...but I will by 5pm". What sort of after sales service would I expect from a "there it is, take it or leave it" firm ? Not much !
Doesn't take much to make most potential customers happy. And they are the best advt you can have.
Sorry about the rant but I dont know how some firms remain in business. About half of the companies I send emails to don't bother to reply. Those that do are usually excellent to deal with. Often these are smaller companies who appreciate my business. Sometimes they are more expensive but I'll choose them anyday.
Off soapbox now :))
Cheers
Jim

I am not suprised, there is no common HF digital selcall standard
based on CCIR/ITU-R 493-4 digital selcall/telcall standard. used by
australian HF radio vendors.

there is codan, barrett, qnet, west aussie govt WA2 format and others

As i have found out to my discust trying to use a ex WA CALM radio
with selcall trying to use it in codan format.

Why in this age of open standards the ACA mandate a standard we call
all use.

Frank,

You have raised some interesting points.
For many years the Codan selcall, based on CCIR/ITU-R 493-4 has been the de facto standard. Copied by the likes of Q-Mac and Barrett, who then complained bitterly when Codan went to 6 digit selcall and made it harder to reverse engineer. About a year ago Codan placed their selcall protocol in the public domain as an open standard.

Although the NGT can't be physically connected to an NGT, there's no problem selcalling into an IPC-500 base station from an NGT mobile.

Hope this helps

John

Hi. The ss whip can be bought from Codan but at great expense. You are probably better off buying both a 27meg ss whip and an adaptor to suit.
Frequencies in the 8528 are programmed into the eprom. You'll need another eprom with whatever frequencies you want programmed into it. Don't forget that if you want LSB on the CB frequencies you'll need another additional xtal, and you'll also need the low power loom fitted. The final transistors are limited to lower output at those frequencies.
Cheers
Jim

3223. Re: [codan_outback_radio] Re: Codan 8558 whip

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-08-24 12:52:58 UTC
From: John Poelwyk - Western Diving Industries
Topic: 3219 Message: 3223

My understanding is that the Fibreglass whip is the primary and operates over the full frequency range of the unit.
The stainless whip is a back up for emergency use only and does not have the same frequency range, suitable for the range of 2.5-30 MHz.

This info is available in PDF format on Codan's web site. Have a read.

It would seem that to use the SS whip will restrict your ability to gain the maximum efficiency out of the unit.
So why bother if it has this affect.

By the way I did not think that you could run CB frequencies on the unit, different spectrum not compatible. (Stand to be Corrected)

Regards
John

3224. Re: NGT Question (for a change :)

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-08-24 13:07:19 UTC
From: Sam Point
Topic: 3214 Message: 3224

Well JIm, we even have a special selcall type for work, which comes up as selectable on scroll when setting the selcall address in the 9323's and NGT's! But if the radio doesn't have the selcall type needed we select "RFDS" and it still works, at least if we select "4 digit compatible" it does. This only has to be done on those radios that have gone "Brain Dead" and lost their special software access codes when they have had their firmware updated from v1.14 / 1.16 to v4.31 / 4.32 and the chip upgrade wasn't done in the correct order with non-volitile writing to new volitile memory before changing chips. What a pain.
The IPC-500 will not work with 6 digit selcall addresses but I haven't tried the new NGT's yet on our unit yet. Our region uses a mixture of 6 and 4 digit selcalls with the 6 digit being a trial and have they found some problems!

And yes I know it's not Thursday night Jim! Been out playing Rural fire Brigades tonight and need to thaw out.

Sam

Last time I checked CB is in the 27 MHz band, well inside the range of a HF radio, but will be SideBand (USB or LSB) not AM, You are thinking of UHF CB

John, if you check the archives of this group you'll find that this may not always be the case. Mounting, earth etc will all have an influence on frequency range. With a 9350 sitting on my garage floor and earthed via a jumper to a sit on mower (!) I can easily tune 2020 with just a steel whip.

Cheers
Jim

Jim Thanks for that info, It certainly shows that HF is not an exact science.

The info I obtained about the Freq range was off the Codan web site so I still ask the question as to why you would compromise the performance of the radio by not using the main whip as designed. As they say the SS is the back up for emergency use.

I certainly cannot imagine carrying your ride on mower around the outback so that you can use it for an enhanced earth. LOL.

Codan must have undertaken extensive testing to ensure that they matched the best Ariel system to the unit and that is why they supply the system they do.

The point about CB freq you are correct I did think only UHF as virtually nobody uses 27 Meg these days.

Thanks for the info I learn something new everyday about HF.

Regards
John

But mounting the ariel on the rear wheel carrier is going to make much more difference to the output than which whip you use.

Hi Bob. Never heard of it being done, but have a peek at the 9350 interface and it *should* be a very similar process. However you'd need to use an 8551 control box as the 9350 has the control circuitry built in.

Cheers
Jim

Hi Sam. Thanks for that info, especially the IPC500. Very interesting. Sounds like the selcall mess isn't really sorted out yet everywhere, which is what someone else here said. What ? You guys get fires up there, I thought it would be too cold. Oh hang on, maybe thats why you have fires :))
Have to admit to checking my calander when your post came up. But thats better than another guy I know....when he emails I check the YEAR :)))
Cheers

Subject: [codan_outback_radio] Re: NGT Question (for a change :)

Well JIm, we even have a special selcall type for work, which comes up as selectable on scroll when setting the selcall address in the 9323's and NGT's! But if the radio doesn't have the selcall type needed we select "RFDS" and it still works, at least if we select "4 digit compatible" it does. This only has to be done on those radios that have gone "Brain Dead" and lost their special software access codes when they have had their firmware updated from v1.14 / 1.16 to v4.31 / 4.32 and the chip upgrade wasn't done in the correct order with non-volitile writing to new volitile memory before changing chips. What a pain.
The IPC-500 will not work with 6 digit selcall addresses but I haven't tried the new NGT's yet on our unit yet. Our region uses a mixture of 6 and 4 digit selcalls with the 6 digit being a trial and have they found some problems!

And yes I know it's not Thursday night Jim! Been out playing Rural fire Brigades tonight and need to thaw out.

Sam

Jim,

Sorry, I didn't clarify the selcall issue totally. I had assumed 4 digit was the preferred method. Yes, there are complications using 6 digit. Stick to 4 digit and you should be OK calling into IPC500.

Jim <jimshire1@...> wrote:

Hi Bob,
I believe that there is a couple of mods out for connecting the 706 to a 9350 (can only find one of them at the moment), but have no personal experience on how they work, link below for the mods:
http://mods.dk/mod/icom/ic-706pro_9350_wiring.pdf

Will post the other link when my brain starts working better and I remember where I saw the mod, hope this helps Bob.

There are 2 ways to go. One is to interface the Codan I2C data bus with the Icom data and provide the appropriate support voltages. The scan amp could be activated manually.
The simple way would be to use an swr bridge and simply turn the stepping motor until minimum swr was found. A tune function and a switch with forward and reverse and hey presto ! .....maybe :))

Cheers
Jim

John,

The Codan website refers to the S/S whip supplied with the 9350 as standard, which is somewhat shorter than the large fibreglass whip and, as you say, will not tune much below 2.5mHz.

Most of us have, long ago, busted the original whip, as they were prone to breakage down near the 'winding' or 'spring' near their base. Replacements can be obtained quite easily by making an adapter for the large thread on the antenna base or spring to a standard 'CB' type thread and any longish (Low band VHF for example) whip will fit and tune adequately across the RF range of the antenna. I have tested mine with both the big black whip compared to the S/S whips that I have and have not really been able to notice any difference in received signal strength. (There are a couple of photos of my adapters in the photos section on the website).

I save the black whip and ginormous spring for when I want to intimidate the anti-4WD, buzz box brigade.....;-)

Cheers and hope this shed some light for you..

Mark

back in about 1998/99 I knew a ham in the Hornsby area who had a 8558 fitted to a IC 706 so it can be done, if you have the 8551 control box refer to the manual as there is a section for fitting to non auto tune capable radios and 3rd party radios ...

the manual for the 8555/8551 autotune (one before the 8558) that I had had info in for the 7727\3rd party etc. you just had to install a seperate tune button which you could probably use the IC 706 rear plug to do this for you

Regards

Paul

Jim,
things are now becoming clearer, those transmissions of yours that seemed to be broken are so for a reason, the hydrocarbon powered CHOPPER is affecting the DC input to the LSB modulator just before the IF comparitor. All this has an effect on the fluxing of the electrolytics beside the RF poweramp & the under rated FINALS are working overtime trying to get some juice down the co-axe that is entangled around the cutting disk.

Man, sure conjures up a great picture to add to the web site - Jims ride on mower with a 9323 & 9350 autotune mounted.

Cheers

Good idea i have been looking for the same too, not found any CCIR 493-4 selcall telcall decoding or emulation s/w for a PC sound card , even though the data rate is 100 baud fsk, the same as sitor/amtor ect, and there is a few amtor decoders using pc sound cards.

Any bright spark got any ideas, or if there is a decoder for a sound card, the only stuff i have found is DSP based decoders costing lots of $$$

Ahhhh...the penny drops. So without a compatable second tranceiver its difficult to know if your selcall works. What about recording your selcall transmission when connected to a dummy load, and then feeding it into your rx ? Just an idea.
Cheers
Jim

Hi Michele. Yup, my fancy needs to be unbridled all right. I thought I could decode any selcalls made with an 8528. But I can't output em to a printer or puter for management/records. I suspect that some networks here record selcalls ...not sure for what purpose. If that's the case they would probably never admit it anyway, much less tell me how or why they were doing it.
I guess that I've never been in a situation where the air was clogged with selcalls and I needed to know how when where and why. In fact when my selcall goes off I am usually so surprised that I jump.
I grow old I grow old :))))

Cheers
Jim

Hi Jim - yes there are networks that do monitor selcalls. The 737 network do this - as evidenced by Steve (?) jumping on to tell people off for not using a registered selcall number (i.e. non licenced operators).

No worries Martin, glad you managed to find one. S/S whips tend to last longer in my experience...unless its an early one that Codan supplied with the twist in it.
Now you can wipe out floros at service stations and feign a look of surprise saying "Who ME? . I havent even got an aerial big enough " :)
Cheers

You CUT it!

Longer on a tuner is usually better (specially if you want to listen to the ABC on the AM broadcsst band :-)

Hello Franco and Michele. If you have a look at the files section you
should find the papers I have from Codan
that I uploaded a while back on the Selcall formatt and decoding process.

3261. New into the private HF world

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-08-28 08:27:47 UTC
From: deanonsw
Topic: 3261 Message: 3261

I am looking into the purchase of a HF radio for fitting into my 4WD to provide communications whilst on long trips. I am researching at the moment, with a view of purchasing towards the end of the year, early next year.

I would love to be able to have the money to go out a purchase a new Codan NGT, but it is out of my price range and was interested to find out whether some of the older Codan (and Barrett) radios would be suitable.

I would like to be able to have a radio that could connect to a data modem also.

I have plenty of experience with HF, but none with commerial radios off the shelf/second hand.

1. What are some of the advantages that the Codan 8525/8528 have over the Barrett 550/950.
2. I am interested in opinions in best value for money on the avail second hand radios.
3. Can the 8525/8525 connect to a data modem ?
4. Any other tips avail.

regards

Deano

Jim,

What's the problem? No Receive or no Transmit?
If you're getting that 300Hz tone in the speaker, see if H1 and/or H2 are lit on the Rx/Exciter & Control PCB.
I've got the X2 TSM if you need it.

Cheers,

Alex

Hi Alex and thanks for the info. Havent actually taken it to bits yet as it appears to only need reprogramming. TX/Rx appear to be ok. I'm assuming that its pretty much the same deal as the 9323 programming wise.
Interestingly enough that tone has now disappeared! Sounds like an intermittent of some kind. But it only appeared on the one chan.
I have the op instructions and the mic pinout . Not sure how many X2's I'm going to see ..hopefully not too many :))
Many thanks for the offer. I don't appear to need it ATM but I'll monitor the thing for a while. You dont happen to have the programming lead details I suppose ?
Cheers
Jim

Hi Graeme,

What do you want for it??? Wouldn't be the end of the world if it was a remote.
Regards,

Malcolm Langley.

Hi everyone,
Don't know if anyone can help but, I are looking for a 8528 local for a
customer in NZ. If anyone has one for sale can you please contact either
myself or Jim HZ180.

Regards,

Malcolm Langley.

3274. HF Auto tune mounts

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-09-01 01:30:50 UTC
From: Matt
Topic: 3274 Message: 3274

G'day the group. Over the last year there have been several discussions regarding where auto tuners should be mounted for both legal reasons (yes those lovely RTA people and other associated groups - definitely tongue in cheek there) and for best operation. I currently have my 8558 tuner mounted on the front left side of my bull bar and am quite happy with how well it operates, but have become increasingly concerned with the tales I have heard of people being hassled by narrow minded bureaucrats. As I have just purchased a 9350 to replace the 8558 (sorry Malcolm, just beat you to it), this has given me the excuse to spend some money and finally pushed me to do the job (the pleasures of being a singly with no financial commitments). I offer the following thoughts for the group for those who are thinking of doing the same thing.
For me, it is an expensive operation as I am replacing the rear bar on the cruiser with a kaymar step and rear wheel carrier and at the same time I am also upgrading (and lifting) the springs/shockers.
From what I have seen in the photo section of this group, there appears to be a number of different methods and devices available (thanks to the guys who have put there photos on the site as it has been very helpful). I decided to go with Kaymar, and found three different mounts that they sell for the rear: one for mounting on the wheel, and two for mounting off the swing arm for the wheel carrier.
The position on the back of the wheel would probably have the least interaction between the tuner and the vehicle, but it looked to be too easy to remove (thieving bastards abound unfortunately), so I discounted this position.
Of the two mounts for the tuner on the rear wheel swing arm, one mounts almost directly off the arm and puts too much of the tuner in close proximity to the vehicle (potential for interaction problems), so this was my least favoured option.
The second mount (Kaymar part number K6217) appears to consist of some RHS steel that raises the mounting plate about 500mm above the rear bar, hopefully reducing the interaction between the car and the tuner.
I do realise that this is not the ideal position (we all know that the bull bar is), but sometimes we have to make the changes that we don't want to, and I think that the position that this antenna will be in is the best that it can be for the rear of the cruiser.
I am about to move to Darwin and am doing this in a bit of a rush, but when I am settled in, will make sure that I post the piccies of the final installation, rationale, etc to the piccies section of this group when I get some time to do it.

Cheers all and catch you on the radio (maybe)

Matt

Yeah, saw the locking mechanism, but it is only a deterrence and it didn't leave me with warm and fuzzy feeling,
With the spare tyre going to the rear, I now have the room to put in a decent sized long range tank - replace the 55L sub tank with a 170L tank which is very tempting, but at about a grand for the long range tank (fitted), this will have to wait a bit, and at the moment, I like the idea of being able to carry two spare wheels without having to unnecessarily put weight on the roof rack.
Timing of the move does suck - I would much preferred to have made the move in about April or May, but such is life and I will be making the move in another couple of weeks (must remember to join up with the VKS737 group again).
Currently playing with a mileage chart for the trip and cursing the differences between the different maps that I have as it is becoming very confusing (three different publications and the online travelmate system all giving me different distances), still, perservere and overcome I always said.

Hi Matt,
Haven't had a chance to try it in anger as yet. Put some photo's of my truck on the web site about 15 minutes ago. Has pics of how my antenna is installed. Haven't had any problems with the location as yet. We can still have them on the front bar but its too close to the electronic injectors there. Would be even better if I could mount the antenna on a trailer and tow it 10 mtrs behind me. Hmmmm. There's a thought :-)))

From: dkjonesau
Topic: 3280 Message: 3280

Oh how I envy all the Patrol and Cruiser owners now, with their swing away spares that they have to open to get to their cargo?

Prior to aquiring a HF I had always thought that to be a frustrating thing to have to do every time you wanted to get in the back.

I have a dual cab ute with canopy. The back is set up with drawers and fridge requiring full tailgate access.

On the front I have an ARB Winch Bar with IPF driving lights and winch. The antenna mounts on there are not suitable for an autotune. They only just support the tapped whip.

I'll post some pictures to the Photo Section under Dave's Dilemma or some such title and I am open to suggestion.

As I see it I have a few options.
* Weld a tab on the top of the bull bar gusseted to the upright support for the top tube. If I do this it really needs to come off the back of the bar to offer maximum protection to the Autotune and to pedestrians but if I do that I may not be able to open the bonnet

* Manufacture a swing away antenna mount which I will then need to open any time I want to get in the back. From an ex comms techs point of view movement of cables every time I open it is not optimal and manufacturing something which will survive the Canning or similar will be a challenge. I do have to modify the tow bar and step anyway to reduce damage and increase the departure angle so this may be an option.

Any suggestions welcome.

(And a challenge - if anyone can identify the brand of whip in the pictures I'd love to know what it is...it's tapped for VKS737 and 5300/5360 RFDS and the frequencies and wire length (825mm)are engraved into the blue polyurethane/epoxy coat.)

Regards & thanks in advance,

Dave (new member)

Hello Jim, Malcolm and group.
We had an interesting email come through work today, forwarded from the crystal palace down south :-).
It originated from of all places Toyota Australia! They are inquiring about radio interference with turbocharged
100 series, 78 and 79 series landcruisers! "Finally" I hear some of you say!
Apparently noises have been made to head office (Toyota) and they have asked Australian head office
about the reports, who have then turned around and asked various fleet owners (Government, big business etc.)
about the problem. The tickler is, they are only refering to interference to UHF radios! Not HF! I haven't
looked into it but I think they mean Australian UHF CB units on 476 - 477 mhz. I haven't noticed any problems
reported in our region but as we mainly use commercial UHF frequencies and some UHF CB channels
programmed into commercial sets (Tait 2020.) maybe it only effects the cheaper CB units. A lot of the country
units are fitted with a standard UHF CB but these are mostly GME TX4000's, 4200's and 3400's. We have noticed
interference from Turbo 78's on 10 mhz HF channels though. All our other 2, 3, 4, 6, 7 and 8 mhz channels
don't seem to be affected or if they are it is negligable. All units are Codan 9323's with 9350's mounted on
the bullbar with cables running down the inner guard area behind the battery to the firewall.
Maybe the UHF CB's affected use a 10.7 mhz IF and this is where the interference is getting in. Also it
may depend on where the UHF antenna is mounted. Mainly ours are roof mounted with only 2 that I know
of mounted on the Drivers side of the bonnet on bonnet mounts, not the passenger side.
Any thoughts people?

Sam

I haven't investigated it (not owning one) but I would be surprised if you were not able to retain full tailgate access with a swing away mount.
If you did want to go for a bullbar mount, I guess it depends on the amount of room between the bar and the bonnet - I am lucky as the gap between my bar and bonnet is about 6 inches (good old PTO winch war) so I have no problems with mounting the auto tune on the bar.
Without pulling out the tape measure I cannot tell for sure, but it lloks like you have heaps of room to put in a bracket for a HF auto tune.
I didn't weld up a bracket - rather I used a piece of steel and two "U"bolts to fasten it to the bar - may be another option for you - if you want, I will take a piccy of mine and send it to you.
As to what brand of tapped whip, not sure. The tip and base of the whip do not look like any of the terlins that I have, but the general construction appears to be almost exactly the same. Not to sure how many other manufacturers of tapped whips there are in Aust.

Matt

Subject: [codan_outback_radio] Where do I put my autotune???

Oh how I envy all the Patrol and Cruiser owners now, with their swing away spares that they have to open to get to their cargo?

Prior to aquiring a HF I had always thought that to be a frustrating thing to have to do every time you wanted to get in the back.

I have a dual cab ute with canopy. The back is set up with drawers and fridge requiring full tailgate access.

On the front I have an ARB Winch Bar with IPF driving lights and winch. The antenna mounts on there are not suitable for an autotune. They only just support the tapped whip.

I'll post some pictures to the Photo Section under Dave's Dilemma or some such title and I am open to suggestion.

As I see it I have a few options.
* Weld a tab on the top of the bull bar gusseted to the upright support for the top tube. If I do this it really needs to come off the back of the bar to offer maximum protection to the Autotune and to pedestrians but if I do that I may not be able to open the bonnet

* Manufacture a swing away antenna mount which I will then need to open any time I want to get in the back. From an ex comms techs point of view movement of cables every time I open it is not optimal

and manufacturing something which will survive the Canning or similar will be a challenge. I do have to modify the tow bar and step anyway to reduce damage and increase the departure angle so this may be an option.

Any suggestions welcome.

(And a challenge - if anyone can identify the brand of whip in the pictures I'd love to know what it is...it's tapped for VKS737 and 5300/5360 RFDS and the frequencies and wire length (825mm)are engraved into the blue polyurethane/epoxy coat.)

Regards & thanks in advance,

Dave (new member)

Hi Sam,
It appears that there is going to be all sorts of problems with these new vehicles with fuel management systems.
The computers in my Isuzu Bighorn (Holden Monterey) chuck out noise which knocks out one of my UHF CB channels, 16 I think, so I have to delete it from the scan. I know the Police are having big problems with their 80 MHz frequencies with the computers in their new Holden Rodeo's Isuzu's) opening the mutes. My 86 MHz frequency is also mute opened by the same computers. To make things even worse, I have to block out another UHF CB frequency when my 8528 is on as it opens the mute on the PRS radio, 28 I think. The electronic injectors cause sparking type noise on my 7 MHz HF frequency. All in all its a real pain and I can only see it getting worse, not better.
My last Isuzu Bighorn with the 3.1 litre motor only ever interfered with anything if I had the air con on high and the wipers turned on.

Malcolm Langley.

Hi Sam, well what do you know. About ^&%& time :) I know that some list members have been through this. It appears to range from specific frequencies that are rendered useless through to people complaining that they are all rendered useless. I'd guess that for example a ham might notice it more than a network user because of the spectrum involved.
I'd heard on the 80's cool list that some members with t/d 100 series have complained that the radio is only operable when the engine is stopped.
If Toyota are aware of it perhaps someone might start doing something about it.
Maybe....one day.....

Cheers
Jim ("Oh what a racket.....Toy ota!")

That certainly doesnt look like a Terlin whip, it isn't stamped and the bottom's all wrong. Doesn't look like a Lencom one. Hmm...numerous whip manufacturers over the years but I can't place that one. I know Bushcom have just bought one of their local whip manufacturers out, the news should be on their web page shortly. They are talking RFDS ansd 737 for $300 and also a screw together version.
Cheers
Jim

Dave,

Mate of mine had a dual cab up in Alice. He mounted his autotune thru the canopy (yes, he cut a 4" hole) behind the driver and used a rubber boot from a hardware store (plumbing section) to keep things water/dust tight. Think he had about the top 4-6" of the autotune projecting thru. It seemed to work ok.

Thanks Jim & Malcolm,

It works well I was just a bit curious.

Interesting about the bushcom antenna. Still lots dearer than the Frankston Amateur Radio club one at $130-150. Though you'd still need to get a spring base for that one - does the Bushcom one come with a base or is that extra?

Still not sure about the autotune mount. Anyone got any good designs for a home made swing away??

Might consider flat clamped to the bull bar first, if I can clamp it solidly enough.

Dave

Dave, I think Sam mentioned that he'd used a clamp arrangement for an autotune before so you should be right. I had mine welded on...well and truly. I'd guess that "Kaymar" isn't really a magic word, and any solid home made bracket should be ok.
I could be very wrong here but I don't think you'd have too many hassles from the police in the NT with a front mounted aerial. Ian would know. Your insurance company may be a different matter. If someone walks in front of your moving vehicle I suspect that their insurance company would take one look at your aerial and say "you beauty !" Your insurance company would probably dump you in a heartbeat. It's a nasty thought but in these days you have to think insurance before radio I rekkon.
Cheers

OK OK OK - I am getting off my arse now and going outside to take some piccies of how my auto tune is currently mounted using a clamped on piece of steel bar. It is now dark outside (and bloody cold - bring on Darwin weather), but I will hopefully have some piccies posted to the site shortly. If I get a (nother) cold, it is ALL your fault Jim! ;-)

OK OK OK - I am getting off my arse now and going outside to take some piccies of how my auto tune is currently mounted using a clamped on piece of steel bar. It is now dark outside (and bloody cold - bring on Darwin weather), but I will hopefully have some piccies posted to the site shortly. If I get a (nother) cold, it is ALL your fault Jim! ;-)

Well, my beany is on my head almost 24/7 at the moment (including now as I type this (don't go visual, very unattractive picture). I have only recently returned from overseas and the temperature difference is around about 50 degrees celcius! POK, piccies have been taken, and I am currently reducing them in size and then trying to figure out how to upload them to the group piccies drive. There shortly.

OK, have now uploaded the piccies and put them in a folder called clamp mounting (yes very imaginative, but you get that). Bit of surface rust, but doesn't impact on it's functionality. Very easy to make - two "U" clamps (i.e. muffler clamps), a plate of steel, and a drill bit of a suitable diameter to make a big enough hole (now that part was not fun). Probably would have been sensible to have done a better paint job on the plate to minimise the rust, but it has been like that for about 3-4 years now and still going well.

Dave, I think Sam mentioned that he'd used a clamp arrangement for an autotune before so you should be right. I had mine welded on...well and truly. I'd guess that "Kaymar" isn't really a magic word, and any solid home made bracket should be ok.
I could be very wrong here but I don't think you'd have too many hassles from the police in the NT with a front mounted aerial. Ian would know. Your insurance company may be a different matter. If someone walks in front of your moving vehicle I suspect that their insurance company would take one look at your aerial and say "you beauty !" Your insurance company would probably dump you in a heartbeat. It's a nasty thought but in these days you have to think insurance before radio I rekkon.

Topic: 3280 Message: 3306

Exactly Jim.
But here is one for you. Just completed the install today of a newly arrived Turbo Troopie (Arrived yesterday (Wed.) installed today, not a bad turn around.) that is going far west to replace a Hilux they rolled or pranged beyond repair. Anyway the model is: HDJ78R - RJMNZQ With the engine type: 1HD - FTE. And I installed the usual Codan 9323, 9350 and Tait UHF radio. This is supposed to be of the type (Turbo) to have interference.
Upon completion of the install and connecting up the battery connections I proceeded with the first post install test whilst the vehicle is still inside the install bay. This is just to select our 6 mhz channel and select "Tune" to ensure antenna operates, stepper motor operates. The 9350's will tune up inside on this frquency even with the bonnet open. The radio passed the first test. Then I start the motor and check audio level from speaker versus cabin noise (In case speaker is shot or rattly.) and battery voltage. I then change through our main channels checking for birdies.
This time though, on every channel all I could mainly hear was ignition noise just like an old Holen red motor without suppressors! Oh dear. I lowered the bonnet and backed the vehicle out of the bay to give it further checks and wonder of wonders, the noise was gone once I left the enclosed space. I tried revving the motor a few times on different channels but still no noise! I then got out and opened the bonnet again and as soon as I did that, the impulse noise was back!
We have put it on the road as our guys aren't in the habit of driving around with the bonnet up :-) with a note to go on the email to our tech out west to keep an eye on it and if it does get noisy to try removing the bonnet and cleaning the interfaces at the hinge and install some earth bypass straps to the bonnet. My boss and I consider either the "New" Black Box which is mounted on its side between the battery and the firewall or the "Fully Insulated / Isolated" injector piping to be the problem, unfortunately the spec anyliser was out on a service call so we couldn't get it to sniff the problem for us. All the injector pipes are bedded in a rubber insulation where they are clamped to the motor to remove vibration, unlike the old 2H motor. They could probably be individually earthed and that may remove some of the noise as it seems to only radiate into the antenna when there is nothing between the antenna and engine bay. The signal is not getting in throught the RG58 antenna cable which runs along the inner guard behind the black box.
Didn't notice anything on the UHF set though.

Sam

Jim wrote:

>Hi Sam, well what do you know. About ^&%& time :) I know that some list members have been through this. It appears to range from specific frequencies that are rendered useless through to people complaining that they are all rendered useless. I'd guess that for example a ham might notice it more than a network user because of the spectrum involved. I'd heard on the 80's cool list that some members with t/d 100 series have complained that the radio is only operable when the engine is stopped.

Dave, we had a Hilux ute with a fibreglass canopy fitted with 9350 antenna a while ago. Now unit is fitted with steel canopy and have special bracket for that, but that is another story.
The bracket was made to fit between the canopy and top side of ute right on the drivers side back corner, plate held by canopy mounting bolt and then a sort of right angle tab down between the tailgate and area above latch plate and another bolt there. I didn't make the mount up by the way, it was worked out by one of the cockies out West. The antenna sat just above the Tail lights but the bottom was only set back about 1 inch from the canopy. It worked well but I don't know about to much rough track work, there was a note on the dashboard to "Only use Steel flexible whip with antenna." as the fibreglass whip made the antenna base sway to much in the rough.

Yeah Matt, it looks basically the same as the ones I made up for those stupid bars Brissie fitted. Worked well, just decomissioned one last week as the Jackaroo was replaced by a Nissan with a bar that had a tab in the right place with clearance. Mind you took delivery today of a rear door mount for another Nissan that was supplied with a "Genuine Nissan" bar that sits too close to the bonnet to fit a 9350.

From: Grey & Kerryn Campbell
Topic: 3309 Message: 3309

Hi all,

I have a NGT and when I tune to 5455Mhz I've noticed that it sets the light in my brake controller off. I'm not sure if it actually activates the brakes as I don't have my trailer with me. Will try it out with the trailer when I next use it.

I also found that when I tuned to 8022Mhz in my driveway it turns on the solenoid to the auto sprinkler system in the garden beside me.

My main concern is the brake controller. Will it harm it? Has anyone else found this problem?

From: Malcolm at "On-Track4wd" in Greymouth
Topic: 3309 Message: 3310

Hi Greg,
I have had different lights on different vehicles come on at different times when I have used various frequency transmitters. It is stray RF floating around when the antenna is tuning. Have even seen dash board lights flickering to the radio when I have been talking. Doubt it is making the brakes work as that usually requires pressure on the foot brakes to activate. Best case scenario is that the length of cable attached to the brake light is acting as an antenna and receiving the signal. Worst case is that its getting into the electronics and could damage switching transistors if it has any???? Could normally be fixed by putting some form of RF choke in the line to the light along with a low frequency bypass capacitor to earth. Or, if no electronics are involved watch the light flicker as you talk, at least that lets you know the set is definitely transmitting. :-)))

Regards,

Malcolm Langley.

If need be the hole can be repaired with fibreglass or plastic welded (depending on material). Or, what about covering the hole with an air spinner/ventilator or some such canopy accessory?.

Assuming correct installation with quailty cable, both issues are likely to be poor RF suppression on/in the devices in concern.

Use some RF bypassing caps as appropriate.

> OK, have now uploaded the piccies and put them in a folder called clamp mounting (yes very imaginative, but you get that). Bit of surface rust, but doesn't impact on it's functionality. Very easy to make - two "U" clamps (i.e. muffler clamps), a plate of steel, and a drill bit of a suitable diameter to make a big enough hole (now that part was not fun). Probably would have been sensible to have done a better paint job on the plate to minimise the rust, but it has been like that for about 3-4 years now and still going well.

interesting.. I read this as your vehicles dont have any earth strapping fitted. We got our fleet boys to run copper earth braid everywhere and havent had a lot of interference problems, even on the 100 series cruisers..
just a thought
ben

Subject: Re: Tojo Interferance

Exactly Jim.
But here is one for you. Just completed the install today of a newly arrived Turbo Troopie (Arrived yesterday (Wed.) installed today, not a bad turn around.) that is going far west to replace a Hilux they rolled or pranged beyond repair. Anyway the model is: HDJ78R - RJMNZQ With the engine type: 1HD - FTE. And I installed the usual Codan 9323, 9350 and Tait UHF radio. This is supposed to be of the type (Turbo) to have interference.
Upon completion of the install and connecting up the battery connections I proceeded with the first post install test whilst the vehicle is still inside the install bay. This is just to select our 6 mhz channel and select "Tune" to ensure antenna operates, stepper motor operates. The 9350's will tune up inside on this frquency even with the bonnet open. The radio passed the first test. Then I start the motor and check audio level from speaker versus cabin noise (In case speaker is shot or rattly.) and battery voltage. I then change through our main channels checking for birdies.
This time though, on every channel all I could mainly hear was ignition noise just like an old Holen red motor without suppressors! Oh dear. I lowered the bonnet and backed the vehicle out of the bay to give it further checks and wonder of wonders, the noise was gone once I left the enclosed space. I tried revving the motor a few times on different channels but still no noise! I then got out and opened the bonnet again and as soon as I did that, the impulse noise was back!
We have put it on the road as our guys aren't in the habit of driving around with the bonnet up with a note to go on the email to our tech out west to keep an eye on it and if it does get noisy to try removing the bonnet and cleaning the interfaces at the hinge and install some earth bypass straps to the bonnet. My boss and I consider either the "New" Black Box which is mounted on its side between the battery and the firewall or the "Fully Insulated / Isolated" injector piping to be the problem, unfortunately the spec anyliser was out on a service call so we couldn't get it to sniff the problem for us. All the injector pipes are bedded in a rubber insulation where they are clamped to the motor to remove vibration, unlike the old 2H motor. They could probably be individually earthed and that may remove some of the noise as it

seems to only radiate into the antenna when there is nothing between the antenna and engine bay. The signal is not getting in throught the RG58 antenna cable which runs along the inner guard behind the black box. Didn't notice anything on the UHF set though.

Sam

Grey,

As some of the others have said, the problem is stray RF.
Most of it is earth return current trying to find its way back to the battery -ve.
I remember a Land Cruiser where I had to remove the keys whenever I got out 'cos if my 9360 got a call and responded - the central locking would activate!

The main cure is to make sure that the earthing of your 9350 is very good. That usually means taking the paint off your antenna bracket where the 9350 sits so it has clean metal-to-metal contact. Also, is your bracket welded to the chassis or bolted? A weld, even if its only a spot will ensure a good return path.
After that, I've found that clip-on ferrites around affected equipment are a quick and sure way of absorbing RF nasties.

Good luck

John

I once worked and lived on a broadcast transmitter site where the ground radials ran almost to the house. Over time, many had become unburied. The aerial was at least 100ft high and it was very flat country.
One morning the unthinkable happened, it rained and stormed. Can you see where I'm going ?
The house was an old timber iron roofed affair. It was a little messy out the back with stuff lying around. After I got up and went to the loo, in between lightning strikes, I went to wash my hands....as you do.
As my hands approached the tap, there was a crack, zap and a long thin spark came out of the tap.
I washed my hands later in town :))
A piece of iron had fallen between a radial and the house plumbing...which was effectively above ground as we had tanks on wooden stands. Dunno about the electrical ground. To tell the truth after that I didn't care for the place much.
My boss said not to worry about it as it only rained about every 7 years and next time I'd know !

Now that's stray RF :))

Cheers
Jim

Hi Jim,
No, that's not stray RF. Years ago when the YA station went on the air at Mt Victoria in Wellington they noticed some time later that the signal was not going as far as it used too. Eventually they found that down the side of the hill that a guy had put a mast up in his back yard and cranked it up until it was at the right point to light at bulbs in his house. That's where the RF was going, into his lighting system. That's stray RF!!!
Regards,

Malcolm Langley.

I've had a brake controller activated whilst towing and have consistantly had it activate when we got it into our service section. Well, we had 2 horses with flat faces, standing in 12" of horse manure after the 9323 in one of our stock sqd vehicles gave a revertive to a selcall whilst the new troopie was travelling at 90 kmh! Fixed the problem only by changing the brake controller to a different manufacturer from the one supplied, went back to the one with the slide control for sensitivity, can't remember the name. Tried everything else, extra earthing, fitted rf feedthrough chokes on cables to and from controller (That didn't help much as controller had plastic case!), ensured all HF cables and RF cables ran on opposite side of vehicle to brake control line, changed and cleaned earth connections on horse float brake connections etc. Some units seem more sensitive than others, we actually tried 2 others before we "borrowed" the one. in our mechanics troopie. About the only thing we didn't try come to think of it was run the brake control cable to the rear of the troopie in a "Faraday" shielded cable (Take a piece of RG58 cable, earth the braid at one end only and use the centre conductor to run your power through. Do not connect the braid at the other end and don't allow braid to touch centre conductor where terminated.)

Sam

>Hi Greg,
>I have had different lights on different vehicles come on at different times when I have used various frequency transmitters. It is stray RF floating around when the antenna is tuning. Have even seen dash board lights flickering to the radio when I have been talking. Doubt it is making the brakes work as that usually requires pressure on the foot brakes to activate. Best case scenario is that the length of cable attached to the brake light is acting as an antenna and receiving the signal. Worst case is that its getting into the electronics and could damage switching transistors if it has any???? Could normally be fixed by putting some form of RF choke in the line to the light along with a low frequency bypass capacitor to earth. Or, if no electronics are involved watch the light flicker as you talk, at least that lets you know the set is definitely transmitting. :-)))

G'day Matt
Goes on with the spare wheel mounts, between carrier and rear door. The carrier actually presses against the spare tyre to give extra support so dont run arround without a spare or the mount wobbles with a 9350 fitted! That is the way the manufacturer made it to work! To make it lighter in weight I suppose.

Ouch - those poor nags. I reckon there would have also been a couple of inches of manure (but of the human kind) in the cabin of the towing vehicle as well!
Thanks also for the response on the nissan mounts.

Well Ben, if only we could get or Transport blokes to do actually
anything to assist in the fitting of comms gear, it would be a miracle!
Everytime they design a new layour, cage or safety barrier they forget
that we still have to fit the vehicles with comms gear! They don't even
allow us to screw mount control heads or microphone brackets anywhere.
We actually have a laissez fare letter from the regional big boss to do
it though, so an english bowmans sulute is directed southwards when we
attack a new fleet suppliied vehicle.
Haven't found a great need for extra earth cables except on one or
two occaisions and I reckon the vehicles in those cases must have been
factory rejects or made by Ford! By the By, current examination of fleet
vehicles returned with major faults under warranty this year are 3:540,
that is 3 commodores to 540 Fords!

We only have noticed the interference on this one 6 month 04
manufactured Troopie just installed.

Hi Wayne, was only a Friday shot. There has been some serious debate in the past over the merits and demerits of the two brands. I am obviously biased towards Codan for a number of reasons. But I'm not one eyed. Each to his own. Mind you I went close to buying a Barrett interconnect recently...but the price wasn't right. Guess I'll just have to hold out for a Codan IPC500 :))

Cheers
Jim

3327. Codan 9325 Problems

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-09-06 10:30:54 UTC
From: deanonsw
Topic: 3327 Message: 3327

I am interested to know if anyone has experienced any problems with the 9325. I am looking at purchasing one and am interested to hear any tips or things to be wary of re these radios.

Also, I am keen to hear from anyone who has connected a data modem to the radio for email connectivity.

Regards

Deano

I am interested to know if anyone has experienced any problems with the 9325. I am looking at purchasing one and am interested to hear any tips or things to be wary of re these radios.

Also, I am keen to hear from anyone who has connected a data modem to the radio for email connectivity.

Regards

Deano

Yes sorry 9323.

I have been reading up on these and the 8525 and got the numbers
mixed up. My mistake.

regards

Deano

Deano, lots of people on the list have had a great deal more experience with both the 25 and the 9323 than I. But I've had close encounters with both of em :))
The 9323 is the bees knees if you haven't got an NGT. They appear to have few known problems, other than the extensive list of "options" that you have to pay to get switched on if they're not already installed. (e.g. the gps option).
This is the radio I run in my 4wd. Nice small head and I can read what the frequency does eg RFDS Meekatharra.
I suspect that a fan option is needed if you wish to transmit data due to the high duty cycle. Not sure if this can be an add on .

The 8525 is different beastie. Relateively "cheap", has minimum bells and whistles and is still as solid as a rock. A real workhorse even after all these years.

Cheers
Jim

Thanks Jim,

Is there anything to be wary of with either radio (8525 or 9323)

It's for a 4WD fit.

Can you connect an autotune antenna to the older 8525 ?

Deano

Hi Dean,

The 8525/28 will interact with the 8558 autotune if it has the option AD board fitted to control it.

The 9350 has the control circuitry in the antenna and will talk to an 8525/28 without the AD board fitted I believe. I will stand corrected if I am wrong.

I thought I was wrong once, but it turned out I was mistaken..... :o))))

Neither radio has any known install vices. Follow good install procedure eg fuses and earths, run the battery and control leads apart from each other, and you'll have no worries.

There you go I've learnt something tonight. I had an 8727 briefly and given that that works on Xtals I am guessing it requires an antenna controller. Dunno much about that one. Doesn't matter really, I only had it for a week or so and sold it again.

3342. 8558 Stepper motors

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-09-06 15:05:01 UTC
From: Dave Jones
Topic: 3342 Message: 3342

This maybe a question for Jim or Malcolm though someone else may know the answer.

I have an antenna that was apparently not working - which came to me in bits. I'd be interested in getting it going as a spare.

The insides appear to be moisture affected but only in some areas.

Can anyone tell me what I should be able to measure between wires of which colours on the stepper motor in these antennas?
Also if there is some way of verifying the operation of the stepper motor independent of the control board without going back to my theory books.....I'd get a sneezing attack from the dust if I had to get them out.
Thirdly, if I need one does anyone have a stepper motor and/or control board from an 8558 that they may have had a tube failure on?

Regards

Dave

Dave, kinda reminds me of the sillyness we used to enjoy at Uni (things to do instead of work 101:). Since E=MC^2, all matter has an equivalent amount of energy. But to say that something exists, we need to be able to measure it. If we convert all matter to its equivalent amount of energy, we can't measure anything.
Therefore, everything is nothing !

Cheers

Dave, the resistance will only tell you that it's there, not that it works. Now Malcolm may know but I seem to remember voltages and resistors to limit the current. I also seem to remember that the only way to check is to actually use it in situ.
Voltage to the phases is provided by the transistors on the AD board / 8551, there are no motor driver electronics on the control board apart from starting stopping etc The rest is for the preamp. I guess the short answer no :))
No bits left , sorry
Cheers
Jim

This maybe a question for Jim or Malcolm though someone else may know the answer.

I have an antenna that was apparently not working - which came to me in bits. I'd be interested in getting it going as a spare.

The insides appear to be moisture affected but only in some areas.

Can anyone tell me what I should be able to measure between wires of which colours on the stepper motor in these antennas?
Also if there is some way of verifying the operation of the stepper motor independent of the control board without going back to my theory books.....I'd get a sneezing attack from the dust if I had to get them out.
Thirdly, if I need one does anyone have a stepper motor and/or control board from an 8558 that they may have had a tube failure on?

Regards

Dave

Hi Dave,
Yes, I agree with Jim. Little chance of checking the correct operation unless its all assembled. Resistances don't tell you anything necessarily. 8551 measures the forward or reflected power to stop the stepper motor in the right place and it cant do that unless the loading coil is connected along with the antenna. Besides, you cant really say that you can fix these antenna's until you have pulled the same antenna apart 5 or 6 times and hit your head against a brick wall a few times. In fixing the antenna's you often seem to get the most sense out of the brick wall :-))) Best of luck, Bens page is a great help.

Regards,

Malcolm Langley.

Dave, the resistance will only tell you that it's there, not that it works. Now Malcolm may know but I seem to remember voltages and resistors to limit the current. I also seem to remember that the only way to check is to actually use it in situ.
Voltage to the phases is provided by the transistors on the AD board / 8551, there are no motor driver electronics on the control board apart from starting stopping etc The rest is for the preamp. I guess the short answer no :))
No bits left , sorry
Cheers
Jim

From: Dave Jones
Topic: 3 Message: 3347

What's a 9323 and 9350 worth roughly if it's in good nick?

What advantages does it have over an 8528?

(Apart from the fact that the 9350 is a far better autotune than an 8558)

Dave

From: Mark
Topic: 3 Message: 3348

Dave,

I would have said a 9323 and 9350 would be worth around $1800 - $2000 in good condition, until I saw an 8528 with 8558 Autotune sell for over $2000 on eBay....makes the 9323 a bit dearer I guess...

Racked my (what's left of them!!) brains and came up with a few comparisons for you...others may chip in with ones I forgot..

The 9323 has:
1. A better 'user interface' with channels being labelled for easy recognition.
2. Capacity to transmit 6 digit selcall (should we ever need this??)
3. Page Call facilities (text transmit and receive) and a few other selcall facilities that are rarely used.
4. Controls (mostly) duplicated on the handset for easy use).
5. Capacity to decode up to 5 different selcall numbers (may have one selcall number for VKS, another for phone, another for private etc..)
6. Quicker programming by dealer if required. No removing EPROMS etc..just plug in the computer and zappo!
7. TPE link allows access to whole of radio programming, not just 99 'P' channels.

The 8528 has:
1. Capacity to be programmed to transmit in the amateur bands (if licenced appropriately)
2. Selcall 'test mode' - which decodes all selcall numbers without alarming unless it is for you! (shows them on the screen)

Anything I've forgotten??

Cheers,

Mark

Thanks Jim, will look at what I can get second hand. From your point below, it might be good to stay away from the 8525A.

Do you need to consider cooling fans if running a data modem (to handle for the increased transmission rate) or are these radios as good as all reports ?

Deano, I suspect that its easier to fit a fan to an 8525 than a 9323. I seem to remember that you are supposed to order a 9323 with a fan as you can't add on.....hmmm...
Also if you are buying a set merely for voice and data on known channels the 25A would be cheaper, but parts might be more difficult to source.

Cheers

3353. Re: [codan_outback_radio] Re: Codan 9323

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-09-07 09:44:30 UTC
From: Dave Jones
Topic: 3327 Message: 3353

I'd add two twelve volt dc fans mounted blowing straight into the rear heatsink from the top. Would increase the depth of the unit to about 140mm at the rear but not a major drama depending on where you want to mount it. If a specific component inside is getting warm then a small 40mm x 40mm fan could be mounted above it with vent holes in the lid. They are fairly small. But the main heat generating components are already attached to the big heatsink so 2 fans cooling that would have to help.

You'd need to screw a thermocouple to it and run some tests with and without and try and keep that heatsink to about 45°C.

Yes. But you don't want it going all the time as it would increase current drawn from the battery. So some form of thermo control circuitry would be a must. Personally I'd see how Codan do the option. I think the 28 fan option is on Bens page, wouldn't hurt to have a peek.
Cheers

I'd add two twelve volt dc fans mounted blowing straight into the rear heatsink from the top. Would increase the depth of the unit to about 140mm at the rear but not a major drama depending on where you want to mount it. If a specific component inside is getting warm then a small 40mm x 40mm fan could be mounted above it with vent holes in the lid. They are fairly small. But the main heat generating components are already attached to the big heatsink so 2 fans cooling that would have to help.

You'd need to screw a thermocouple to it and run some tests with and without and try and keep that heatsink to about 45°C.

Deano, I suspect that its easier to fit a fan to an 8525 than a 9323. I seem to remember that you are supposed to order a 9323 with a fan as you can't add on.....hmmm...
Also if you are buying a set merely for voice and data on known channels the 25A would be cheaper, but parts might be more difficult to source.

Cheers
Jim

Thanks Jim, will look at what I can get second hand. From your point below, it might be good to stay away from the 8525A.

Do you need to consider cooling fans if running a data modem (to handle for the increased transmission rate) or are these radios as

good as all reports ?

Deano

Jim,

'Spose I should not have forgotten that one as I have just enabled this on my 9323. Can now display the GPS coordinates on the screen (??) and transmit or be 'interrogated' for GPS position. Dunno if I'll ever really use it, but it was fun fiddling around getting it going.

Lucky to have bought the set all those years ago at the 'show special' with the 'password' to enable this option...otherwise it would probably still be an 'option'!!!!

Mark

3357. 8558 tuning problems

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-09-07 13:38:50 UTC
From: Dave Jones
Topic: 702 Message: 3357

Now I'm peeved, just typed all of this, got dumped from website and lost it. Memo to self sent from email program not yahoo groups site. :o(((((

Hi all, (again...)

I have just bought an 8558 of ebay and procured another for parts, including the whip which the first one didn't have.

I received it and had to do a bit of work on it. I will state from the outset that I don't have a problem with that as the guy who sold it was fairly honest about the description and seems straight up on the phone. He also said that he bought a batch and if I get into trouble with this one he might swap it for another. If you've been watching ebay you will know the antennas I mean. They were apparently ex SA Police and have possibly been in storage for a bit. It is a D series serial no.

Anyway, after having solved the broken earthing strap bolt problem by drilling and tapping new holes for the bolts to retain the alloy base plate I serviced the antenna and reassembled it. All appears to be fine.

I mounted it on a portable work bench and placed it at the front of the ute. I connected the control cable (not permanently installed yet) and the coax connector off the tapped whip. I used a jumper lead to earth the mounting bolt to the battery negative.

I then selected VKS737 ch 2 on 8020kHz and hit TUNE. The 8528 beeped a bit. Sounds came from the big black thing and the tune passed. I was quite happy.

At this point I should have gone to bed....

I hit the down ch button and grabbed 5455 and hit TUNE. Same thing, except the two extra tones and the Tune failed message on the display. BUGGER.

I have since tried a variety of frequencies and it will pass tune attempts between about 6500 & 8200 kHz. Anything outside of that fails.

I have tried moving the jumper lead earth closer on the base to the earth strap but still the same result.

********** My question is this **********

Is this likely to be an earthing problem, or something more terminal with the antenna. I don't want to approach the guy I bought it off with a problem that is of my causing. But if it is likely to be the antenna I need to chase it up quick smart.

Interestingly when the antenna is tuning my ARB Compressor switch, the stereo lights, and the central locking all misbehave at times, and they aren't even running from that battery which is isolated as the ignition is off.

I am supplying the 8558 and earthing from the auxiliary battery.

Thanks in advance,

Dave

Hrrmff.

In the time it's taken to type this and go and pull the kids car seats out to make sure the earth strap to the transciever is connected (it is) the b. thing won't tune at all.

Maybe it's the ad board. The antenna sounds like it's travelling all the way in one direction, and returning without finding a tune point then failing.

Technology is wonderfull, now where'd I put that tapped whip???

Not as easy as it looks is it ? :)) The tuning probs are usually caused by earth probs.
Without trying to teach you to suck eggs I'd suggest the following.
Take the coax off and measure the resistance to earth.
Try changing the impedance jumper inside the aerial.
Cheers

3362. Relocating HF auto tune antenna - the continuing saga

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-09-08 09:54:09 UTC
From: Matt
Topic: 3362 Message: 3362

Well, have now (finally) had the new rear step and wheel carrier fitted to the cruiser. Still need to pick up the cable from the local radio shop, but that is tomorrows effort (after the removalists clear out the house). Now comes the fun of running the cables into the car, emplacing the tuner on the mount (an elevated mount), removing the AD board from the radio, and pushing the tune button with bated breath.
Anyway, back to the running of cables - my cruiser is an 80 series DX wagon - i.e. the basic model with the barn doors. I am pretty averse to running the cables under the rear door if I can avoid it, is there an easier way using any pre made holes that are under the vehicle leading inside it? I haven't had a look yet, but thought I might save some effort (have a set of rear drawers that I might have to remove - hope not though) and see if anyone else has gone donwn this path.
Bought myself a new digital camera today (yep, an extremely expensive day), so will keep on taking piccies and will upload to the photos section eventually.
Any comments on how it has been done by others?

Matt

Matt

Plenty of rubber bungs underneath.

Just puncha hole on one. feed the unterminated cable thru, and when all is finished seal it with silastic (after cleaning the adjacent surfaces to ensure a good bond).

Matt

Plenty of rubber bungs underneath.

Just puncha hole on one. feed the unterminated cable thru, and when all is finished seal it with silastic (after cleaning the adjacent surfaces to ensure a good bond).

Dave,

When I cleaned up my 8558 after purchase, I found the copper tuning
coil had endured some arcing in certain spots over time. Additionally,
the lead wires to the moving gizmo inside the tuning coil had become
detached and did not make good contact all the time. After abit of a
scrub and some soldering, it seemed like new (and worked too!).

I just followed the instructions on Bens website to dismantle and put
back together.

Hi all,

Mounted it on the bull bar. It's just on an ARB antenna mount at the moment - flat with bent down gusseting tabs on either side. It's not staying there but I'll play with it there for a week or so until I build my swing away.

Anyway, the good news is that it appears to be working well.

Too late to test fully tonight but I will test it tomorrow and post results.

Night night, 0700 start so turning in...

Dave

I remember quite frequently with the old thing when it wouldn't tune, I had to stop the car, get out and give it a good whack...then it would tune up... didn't know very much about grounding and the like back then, though.

Probably good that I sold it when I did.

Would you buy a used autotune from THAT man????

Date: 2004-09-09 11:21:44 UTC
From: Dave Jones
Topic: 3382 Message: 3382

Well, tried it today.....

Didn't get much of a run at it and I'm on call tonight so it's at work and the big red & white truck is in the drive, so I won't be doing much tonight :o(

It tunes well above and below where it was though. Still has a problem around 11.5 MHz though.

I had a long chat to Jim on Yahoo last night and when I get it back home tomorrow night I'll try the jumper switch impedance mod, and while it's open I might as well give the tuning coil another clean.

Only problem with doing both is I'll never know what fixed it, but I'd err on the side of the impedance mod if it works.

Getting there slowly,

Dave

Yep, me to. My 8558 has been working very well, just time to retire it because the 9350 is a better tuner (but will probably reincarnate it on the base. Occaisionally it will not tune, but hit tune a couple of times, and it will eventually tune up.
Have travelled some rough territorybut had no real problems with it - when I got it, it looked to be in as new condition internally and externally.

3385. 9350 price

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-09-10 12:39:24 UTC
From: dkjonesau
Topic: 3385 Message: 3385

Hi there all,

Quick question. I haven't seen too many 9350's come up for sale on Ebay or anywhere else on their own.

I am wondering what they are worth in reasonable condition second hand. I know what they are worth new.

I have been contemplating buying a radio & 9350 combination and just selling the radio unless it's better than what I have.

Thanks,

Dave

You would be doing yourself a diservice paying more than 50% retail price of something in good condition, via ebay trading post ect, ill say if you pay more thsan $750 its too much.

Saying that i have noticed bidders with ratings under 5, with id's suggesting they into 4x4, paying totally silly prices for gear that you struggle to get support and parts, i would only pay scrap or Ham use prices.

Regards

So lets do a quick calculation. Cost of 9323 and 9323 new around what , 3900. ?? At 50c in the dollar thats around $1950. Ebay prices are close.
I agree with Frank to a point, the "worth" of something is the price that you're willing to pay. If you are willing to pay 2K for an 8528 then that's its worth to you. If everyone else follows suite, even though I'm not willing to pay that amount, it is still its worth to others. (but not to me).
The sad thing is that people will pay more on Ebay than asking around. Then they buy from someone who either won't or can't provide after sales advice and service.
Guess who ends up holding the baby?
When I buy on Ebay I can bet that many things advertised as in good nick are actually incomplete and not working as advertised. Often this happens because people just don't know, or in a minority of cases are pulling a swifty.
The moral of the story is to buy from a reputable source.

Cheers
Jim

Subject: Re: [codan_outback_radio] Re: 9350 price

So lets do a quick calculation. Cost of 9323 and 9323 new around what , 3900. ?? At 50c in the dollar thats around $1950. Ebay prices are close.
I agree with Frank to a point, the "worth" of something is the price that you're willing to pay. If you are willing to pay 2K for an 8528 then that's its worth to you. If everyone else follows suite, even though I'm not willing to pay that amount, it is still its worth to others. (but not to me).
The sad thing is that people will pay more on Ebay than asking around. Then they buy from someone who either won't or can't provide after sales advice and service.
Guess who ends up holding the baby?
When I buy on Ebay I can bet that many things advertised as in good nick are actually incomplete and not working as advertised. Often this happens because people just don't know, or in a minority of cases are pulling a swifty.
The moral of the story is to buy from a reputable source.

Cheers
Jim

3389. Re: [codan_outback_radio] Re: 9350 price

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-09-11 10:42:12 UTC
From: Dave Jones
Topic: 3385 Message: 3389

That's what I figured. I have been offered one at about $650 from a dealer second hand or $950 once serviced by Codan. The extra $300 doesn't really seem worth if they are offering it in working condition.

Anything they can do to an already working antenna I can do. Dismantle, lube & reassemble. Though given the fact that the tuning board is in the base on these I haven't seen one so don't know if there's any tuning or adjustment required.

I'm not really that interested at the moment. Given that this is a price from a dealer I would assume that I could get a similar unit for a similar price when my budget is better able to cope.

In the mean time I've nearly got this 8558 sussed. I'll play with that for a while.

Thanks for the answers.

3390. That 8558

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-09-17 10:25:48 UTC
From: Dave Jones
Topic: 3390 Message: 3390

Well, short of the fact that I haven't made up the swing away mount to go on the back the 8558 is back in one piece, mounted on the bull bar and working just fine.

Interesting, I've seen comment about 10mm steel mounting points being required. The material on the bull bar mount is thinner but well gusseted. I haven't calculated the physics but I would have thought a well gusseted mount would beat an ungusseted 10mm mount if both are welded to the bar.

Can't argue with the price. I know it's not a 9350 but it was less than half the price of the one's that I've seen and it's working well.

Now I'll see if I can get the second one going. It'll be a bit more work though, but I can't see anything physically wrong with it that a bit of work won't fix.

Thanks heaps for all your help.

Dave

Hi Dave,

You can do as many physics calculations as you want, :-)
doesn't change the fact, that the post only has enough tread to be
tightened up to about 8-9 mm

Cheers,

Stefan.

3400. Got Home OK

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-09-22 05:15:36 UTC
From: locallawoff
Topic: 3400 Message: 3400

Gidday Jim,I finally got home in one piece.I bought a Jayco Swan Offroad camper and stayed at a van park in Jandowie on the way home.Got up next morning folded up the van and headed home.300 ks up the road Viv asked what I did with the handle to wind up the roof.Looked in the rear mirror and there was a nice hole where the handle had been.The trouble is that you cant get into the van with out it.Now I have 2 handles and are painted fluro pink that can be seen everywhere.
I also got a manual for the 5285 and will sit down and try to set up the selcall numbers and also I switched the radio on late at night and all those channels installed programmed are oseas etc radio stations so I can listen to the news where ever we are.
Thanks a lot
Martin (locallawoff)

Hi Martin, good to see you got home Ok. The handle episode is what makes these trips more memorable. In years to come you'll laugh about it, but at the time ...well enough said. Yes the broadcast stations can come in handy. I miss the rest of the world after a while...still haven't worked out why. The internal selcall setting is easy, as long as you don't set them reversed as I have a few times.

Cheers
Jim

Hi Jim,

The internal selcall setting is easy, as long as you don't set them reversed as I have a few times.
Why does that not surprise me ?????? :-)))))

Regards,

Malcolm Langley.

Hi Martin, good to see you got home Ok. The handle episode is what makes these trips more memorable. In years to come you'll laugh about it, but at the time ...well enough said.
Yes the broadcast stations can come in handy. I miss the rest of the world after a while...still haven't worked out why. The internal selcall setting is easy, as long as you don't set them reversed as I have a few times.

Cheers
Jim

3410. 8558 bits

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-09-22 12:36:39 UTC
From: Dave Jones
Topic: 3410 Message: 3410

Hi there,

I've got a spare 8558 that I don't even know if the internals work on, but I can't find out as the person who dismantled it left the 4mm terminal in the top of the housing. I got the f/glass/round brown housing out with some effort but the 4mm plug is stuck well.

I either need to work out some way of getting it out - and I cut the handles of a pair of small pliers today and welded 70 cm long handles on and it's still in there - or get another housing.

Anyone got any ideas? Particularly on getting the plug out?

Alternatively anyone got a housing? (D series serial no if it makes any difference)
Given that the internals are usually what fail there must be a housing kicking around someone's shed.

Thanks in advance,

Dave

Dave, I'm assuming that you mean the bit where the aerial normally screws into ? Drill it out. My last housing went to a good home in Wa so can't help there.
If all fails, save it for bits to repair the other one .

Cheers
Jim

Hi Jim,

Not quite sure what you mean. The tip of the tuner in the housing interfaces to the whip via a 4mm banana plug that plugs into the top of the antenna base housing. I assume theres a 4mm hole into the bottom of the bolt coming out the top.

The 4mm plug is still in the hole :o((

If I can get it out I can probably fix it but my arm's not that skinny.

From: Malcolm at "On-Track4wd" in Greymouth
Topic: 3410 Message: 3414

Jim,
He has busted the banana plug off the top of the tuning assemble and the part of the banana plug is stuck inside the top of the housing. Sounds like a real problem to me. I doubt he will be successful in recovering the broken bit as if it was that easy it would have come out of its socket with the tuning assembly. If he was successful then he would need to put a new banana plug on the top of the tuning assembly.
Sounds like either a replacement housing or cut the top off, recover the broken part of the plug and fibre glass the top of the housing back on, or keep it for parts and get a whole replacement 8558.
Regards,

Malcolm Langley.

From: Ben Hobson
Topic: 3416 Message: 3416

Dave
try this
turn the housing upside down and fill the bottom with penetrating oil of some kind and leave overnight
turn it back up the right way and heat the top with an oxy (the metal centre part where whip screws in) get it nice and hot and give the whole housing a good tap..(bang it on the floor)
it might work, it may not but i figure youve got nothing to lose at this point. Ive never seen this problem before...
FYI all the 8558 housing are the same
cheers
ben

Hi guys,

Take a look at this thread on www.ExplorOz.com

I don't like the sound of this. I've been following the debate for a little while. It doesn't look good for us. I know Steve Johnson from VKS737 is very concerned.

For what good it will do I've written to the politicians.

http://www.exploroz.com/forum/View.asp?ForumQID=16485

This really sucks.

A follow-up has been lodged from Member - John (Vic) at 6:25:47 PM on Thursday, September 23, 2004 Australian EST

Click here to view the thread online, a copy of the follow-up is shown below for your reference.

Dave the "huge negative ramifications for HF" are correct.
It will mean the end for HF in this country, the interference is so great over such large areas of the country as to render the frequencies unusable, thats why the HF community is so concerned about it.

I just spoke to a very well respected gentleman here in Melb who has been involved in the radio business for more than 30 years, including being a founding member responsible for the setting up of the VKS network, he also makes his living from selling and servicing HF and other radio services.

This person has just been involved with a series of meeting's about BPL and has come away with the view that HF is finished in Aus with the inception of BPL.
He told me with all conscience that he would not sell me a HF now knowing what he knows.

I think it stinks to but that's life sorry to say.

Hi Dave, BPL has been recognised as a serious problem by the amateur radio community for quite a while now - since at least the start of the year if my memory serves me correctly. There have been a number of trials conducted overseas (including Europe, the US and Japan) where serious levels of interference have been recorded. From my understanding, it is not so much of a problem for mobiles out in the middle of nowhere (although the potential for propagation to cause a problem for mobiles certainly does exist), but particularly for bases in the cities or the more inhabited areas (which for VKS737 I believe is where most bases are located), the ramifications are terrible - pretty much constant S9 signals is what I am led to believe.
What I find particularly offensive is that as recreational users (i.e. amateur radio operators, 4wd radio networks and other non big company users of HF) we are perceived to be unimportant by the BPL proponents. They recognise that the BPL would not be efficient without their being able to effectively wipe out all other users of HF in this country - and I believe that there are other systems available that are actually more efficient than BPL without the interference to HF
The main push from this is the power companies who see an easy way to make a dollar without worrying about who it may impact. I believe that this system is also reasonably easily interfered with, so if it does go ahead, I can see an aweful lot of beacons being setup on the amateur bands to repay the interference back in spades.

Matt

3423. For Sale - 8525 Mobile HF with Multi Tap antenna

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-09-23 23:48:37 UTC
From: Mick
Topic: 3423 Message: 3423

Hi Fellers,
I don't know if anyone is interested or not but I have a Codan 8525 selcall mobile with a Survivor 16 multi tap antenna for sale. It is an ex Desert Access unit packed in a aluminium case but can be removed and fixed in a vehicle if required. I have just come back from a trip north and it works fine. Is fitted with all RFDS and VKS-737 frequencies.
Asking price $950.00.
Anyone interested please reply to micknews@...

Thanks,
Mick.

3424. Important Information about EPIRB

From: Michael White
Topic: 3424 Message: 3424

A little off topic,
but if you are thinking of buying an Epirb
for when HF becomes unusable
due to BPL powerline interference
essential to know
The site contains important information about distress beacons and changes
to the distress beacon system.
The site also contains information on caring for and maintaining your
beacon, a simple to understand description of the search and rescue
satellite system and important information on the use of EPIRBs. It also
contains the Cospas-Sarsat hexadecimal decoder.

3425. BPL...how great a threat ?

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-09-25 01:39:37 UTC
From: Jim
Topic: 3425 Message: 3425

I'm not in favour of anything that interferes with any HF communications in Australia. I'm as horrified as anyone else at the possibilities.
But I'm going to muddy the waters a bit about BPL making HF unusable. I suspect that some of the current hysteria (in some quarters) is a bit pre emptive.

BPL is an expensive technology that requires a fair capital investment in "repeaters" every so often along the electricity distribution networks which were never designed with these in mind. Our population densities are distributed quite differently to many countries, as are our power distribution systems. Not many small towns appear likeley to get broadband internet this way in the near future.
BPL appears to be more economic in the more densely populated city areas.

Some BPL rollouts in the States and other countries have been rolled back due to interference issues and economics.

For many urban dwellers there may well be valid reasons why BPL may become a PITA when trying to use HF. People in areas of high population density may well have good reason to worry. But lets not forget that HF bases can be remotely sited so operation may still be possible. Recent internet technologies make remote operation of amateur stations more attractive, and remote commercial bases have been around for a long time.

For average remote area traveller, I wonder just how much BPL would interfere with their communications ? Many bases are already sited away from possible BPL problems

But to assume that HF will be a wasteland, and that we should all sell our radios while we can (and I've heard this from more than one source) is, IMHO, unwarranted at this point in time.

Cheers
Jim

3428. Codan 7113 P/S circuit

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-09-26 10:22:09 UTC
From: Jim
Topic: 3428 Message: 3428

Some time ago a kind soul sent me the circuit of this supply as a dos printer file. I've only just found time to try it and you beauty. I now have a copy. But I can't scan it as I am still chasing a small scuzzi plug for my adaptec 2940 card.
All is not lost. I'll upload the file and you can print it by using your command prompt DOS window using the syntax "print C:\codanpsu.prn " (if its in the C directory).
So if you need it, there you go :))

Cheers
Jim

3436. F/S 9350

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-09-29 10:23:35 UTC
From: Jim
Topic: 3436 Message: 3436

I have a 9350 A series a/t bare. No whip or cables, working perfectly. Going to chuck it on Ebay but giving the list first show of indifference for a couple of days :))
If interested please offline.

Cheers
Jim

From: Jim
Topic: 3437 Message: 3437

It's my sad task to inform the list that someone that you've probably never heard of here has left his job to go into another field. This person has been our behind the scenes contact with Codan.
In fact Chris Livingstone was Codans Regional Sales Manager. But Chris was much more than that.
Let me give you an example. Someone would ask a question and I'd reply with some Codan specific information. Wow that Jim bloke knows his stuff. Well actually no. Chris would see the post and dash off the information so that I could look good.
There has been much behind the scenes help from Chris who has stayed in the background for obvious reasons. A fellow "ham", Chris was never too busy (and of course he was always very busy) to attempt to help, commiserate or just to have a laugh at the antics and info on the list.
It wasn't just me. I know of a few that know Chris and I'm sure that they'd agree that he helped to make this list a living knowledgeble resource.
On behalf of all those who subscribe to the Codan list, Chris, thank you.
We wish you well in your new position.

Cheers
Jim
PS. Chris, now that you are leaving Codan, perhaps you could post :))

Ah, now you have done it Jim, you are now officially demoted from the position of group guru. You should have left us all in ignorance so that we continued to think that you were the information legend that we always thought!
It is sad to hear that we have lost an asset within the company, but I hopefully Chris has moved on to greener pastures (i.e. better money and less hassles from this group).
I wasn't aware of Chris's assistance to the group, but thanks for it Chrs, and I can only echo Jim's comment re your posting on this group.

Cheers

Matt

Think I'd prefer the NGT model rather than the 6801 version. Mind you the older version can still make the selcall alarm ring, and her power output is still within specs. The problem is that her receiver is somewhat deaf, and she isn't all that reliable because of those old electros that keep blowing.
And boy is it a job to get her re channeled. The newer models you can sit in front of the puter and reprogram in seconds. Poor old Inga keeps heading in the old direction unless you spend a lot of time and money and even then you've still got the older model.
I mean the newer models are so much smaller, cuter and easier to operate, even if you're all at sea to start with :))))))))

Cheers

3442. Ah, shucks....

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-10-01 00:49:32 UTC
From: Chris
Topic: 3437 Message: 3442

Jim,

I'm all embarrased now, so it's your turn!

Folks, I have been supplying Jim with technical information that is normally hard to find, but Jim always asks the right questions and supplies the answers in a fashion that is easy to understand.

I have supplied nothing "company confidential", but have gathered a lot of information after 11 years with Codan, and am happy to share it.

I started with Codan in 1993, responsible for sales in SA, NT and Qld.

They then deported my wife and I to the UK, and I spent 3 years there, mainly working in sub-Saharan Africa.

The next posting was Chile (Sí, hablemos Español), followed by the United States.

Codan finally let me come back to Oz 3 years ago, and I am responsible (until the 20th October) for Australia, New Zealand, PNG and the Pacific Islands.

I have been to 35 counties with Codan (at last count), so it's been a pretty fun ride.

Some less-than-fun moments?
Being shot at in Angola.
Being held up at gunpoint by a drunken cop in Maozambique.
Being tear-gassed in Zimbabwe.
Being imprisoned up in Perú.
Being mugged in Bolivia.

However, they were more than compensated for by seeng the places that I have seen (Machú Pichú is spectacular, and watching the Northern Lights in Iceland on Christmas Eve is not to be forgotten), and I have formed friendships with some wonderful people.

And, of course, I have been selling the world's best HF products during that time :-)

My new employer is SRA Information Technology (www.sra.com.au), based here in Adelaide.
I am really pumped at the new job, but saddened to be leaving Codan after such a long time.

However, I will still be using my NGT as my HF base station, so VK5SA can come out of the proverbial closet without being accused of bias :-)

Jim, Ben, Malcolm, John and their friends provide great advice here, and I look forward to reading it as often as possible.

Cheers,

Chris Levingston

3443. In plain English ?

Yahoo group: codan_outback_radio (1997 — 2004)

From: Jim
Topic: 3443 Message: 3443

Chris, I've embellished the following in an attempt to put a light hearted view on what were obviously not so light hearted moments :-)

Some less-than-fun moments?

Being shot at in Angola. ("I told you we should of included the power connectors!")

Being held up at gunpoint by a drunken cop in Mozambique.("Stand and deliver...you promised that delivery last month!")

Being tear-gassed in Zimbabwe.("But boss, you said to sell where the most people were!")

Being imprisoned up in Peru.(" You will be released AFTER you explain the NGT's menu!!")

Being mugged in Bolivia.("OK hombre, give us all zee dealer codes")

Cheers
Jim

Very interesting
Nothing to do with Codan Hf Radio
But I bet there are some Codan Users that can fill in some of the gaps
Regards Michael

The Degree Confluence Project

The project is an organized sampling of the world. There is a confluence within 49 miles (79 km) of you if you're on the surface of Earth. We've discounted confluences in the oceans and some near the poles, but there are still 12,720 to be found.

From: Malcolm at "On-Track4wd" in Greymouth
Topic: 3454 Message: 3454

Hi everyone,
Don't know if you can help me or not but I have just installed a 8570/ 8571 at my place to move the transceiver away from an electrical hum being generated in our house.
Everything works 100% except for trying to do beacon calls from the 8570. I can do a beacon call from the transceiver itself which works 100%.
Been thru all the manuals re install and operating etc.
When trying to do a beacon call from the 8570 it shows that it is doing it on the display and it makes all the right noises but wont talk to the mobile set.
There are no issues with sending or receiving normal selcall's from the 8570 and it will answer a beacon call. Just not generate one. The gear was originally installed to a 9350 but according to all the books that should not matter. Any suggestions would be appreciated.

Are you using it on a 9350 or 8528 Malcolm?
We use these at work extensively. You can also use the 8528 shortcut
to do a beacon call instead of selecting the call mode via the up down
select.

All,

I am on another yahoo list (unrelated to radio in everyway), and he submitted the same message word for word. The garbage got caught in the moderation there, but made it thru on this list.

Translation from french does not make sense, so I guess its just plain spam.

Hi Sam,
Using an 8528. Series 4.3 software. I assume the shortcut is using the Tune button??? If so that doesn't work either????
I tried using the "Test mode" on the 8528 in the vehicle. When I send a beacon call to it it says that it has gone to "All" and the base has sent it. It doesn't respond to that as an all call as the all call facility in the 8570 is turned off. If it is turned on the mobile will respond to it with the same result in the test model.
I am starting to assume that as a 9350 was originally used with the 8570/ 8571 that there is a software difference but cant find any reference to this being the case in the service info.

Im pretty sure this is a firmware related problem. from memory it needs
to be 3.4 or higher for beacons. and they both must match. its been a
while since i played with these units, so maybe Sam can give some input...
I take it youve been through the line equalisation procedure at each end.

Hi Ben,
As far as I can see all my firmware is above the required 3.5 version levels to carry out the task. The 28's will do both beacon call and 199 beacon call to each other no problems. Its just doing the beacon call from the 8570 itself that wont work. All other functions are 100% AAAA++++

Yes, done and redone all the equalisation procedures. All works 100% with the exception of the beacon call.

Hello Malcolm,
Well we have updated the firmware in the control unit (2 years ago)
so it can be done. The beacon mode (Tune Button) works with our 9350
remote unit as well as the previous
8528. There may be an incompatability between the local (Desktop) and
remote site controller but I'll have to have a look at the spare units
in our store to verify if they have to be
a particular version match. Tis same probelm appears in the 9323 if you
have slighly different firmaware in the head compared to the main unit.
I will also try to remember to pull out
the manual and setup notes (Not in the normal manual.) and go through
them. We did have a problem at one stage and had to change the line in
port on the local control unit to the
second input on the main board (Unplug and replug then tell unit to use
line port 2.) due to control signals not going to remote site correctly
at one stage.

Will check and get back to you.

Just thought of something, there may be a firmware problem at the remote
end as the 8570 and 8571 use the 8528 control head format between
themselves and maybe the firmware
acts as a translator to 9350 control head format when using a 9350.

Sam, you're wrong. If I'd of had no class I would of penned that famous French line which starts with "voulez vous " etc
:-))
Anyway, not bad for a bloke who didnt even get through "La balon rouge" in year 7.
Tray Bi anne eh mon amie ? :-)

Cheers
Jim

3466. Re: [codan_outback_radio] 8570/ 8571

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-10-06 19:56:27 UTC
From: Malcolm at "On-Track4wd" in Greymouth
Topic: 3454 Message: 3466

Hi Sam,
Thanks for your help.
The 8570/ 8571 shows it has version 4.03 and both of my 8528's have version 4.3 software.
Don't know if this helps. Have had the opportunity to check out every single function I
find on the 8570/ 8571 that the beacon call is definitely the only thing not working
whether the Tune button on the 8570 or the toggle up and down/ call buttons are used.

Your assistance is appreciated.
Regards,

Malcolm Langley.

Hello Malcolm,
Well we have updated the firmware in the control unit (2 years ago)
so it can be done. The beacon mode (Tune Button) works with our 9350
remote unit as well as the previous
8528. There may be an incompatability between the local (Desktop) and
remote site controller but I'll have to have a look at the spare units
in our store to verify if they have to be
a particular version match. Tis same probelm appears in the 9323 if you
have slighly different firmaware in the head compared to the main unit.
I will also try to remember to pull out
the manual and setup notes (Not in the normal manual.) and go through
them. We did have a problem at one stage and had to change the line in
port on the local control unit to the
second input on the main board (Unplug and replug then tell unit to use
line port 2.) due to control signals not going to remote site correctly
at one stage.

Will check and get back to you.

Just thought of something, there may be a firmware problem at the remote end as the 8570 and 8571 use the 8528 control head format between themselves and maybe the firmware
acts as a translator to 9350 control head format when using a 9350.

Sam

Ok Malcolm, had a look through the books and notes on our system this arvo and made some notes. Disregard any you currently know.

To put 8570 in "Setup" mode:
Turn on console by holding down both "FUNCTION" and "CONTROL ON/OFF" keys for 2 seconds.
You should see a display that flashes up

```
----------------
| Setup Mode_ |
| |
```

Now you are in setup mode do the following.
Press "FUNCTION" key followed by the function number you want within 2 seconds, then press "ENTER" key.

The first function you want is:
Function
1 General setup. Use the "REVIEW ^" or REVIEW v" to scroll display.
Go through until you find a display that says:

```
----------------
| General Setup |
| Beacon Mode: off |
```

Use "CHANNEL ^" or "CHANNEL v" keys to select on or off. You want it on!

To exit setup mode when finished, turn off console with "CONTROL ON/OFF" key.

Other functions which work when not(?) in setup mode.:
Function
11 Displays Eprom firmware in 8570 and 8571
12 Remote site temperature. Sensor is inside 8571 case so tells you equipment temperature.
14 Local supply voltage info or backup battery duration if in setup mode.
15 Remote Supply voltage info.
19 Audio signal level bar graph.

The other shortcut for "Beacon Call" is to press the "F1" button after you select "Call".
All this is for EPROM versions after v3.02 so you should be alright.
Some of this may help Malcolm. If you want more I'll have another dig in the books.

Sam

Hi Sam,
I answered your other email but thought I would answer this one as well because there are probably others who are interested.

Thanks for the info. What you have described in your email below is how I am accessing the programming already.

11 Displays Eprom firmware in 8570 and 8571 Yes, works fine
12 Remote site temperature. Sensor is inside 8571 case so tells you equipment temperature. Does nothing
14 Local supply voltage info or backup battery duration if in setup mode.Yes, works fine
15 Remote Supply voltage info.Yes, works fine
19 Audio signal level bar graph. Does nothing

The other shortcut for "Beacon Call" is to press the "F1" button after you select "Call". All this is for EPROM versions after v3.02 so you should be alright.Hadn't been aware of the F1 function for this but all it does is toggle between beacon and call like the review keys resulting in no answer from the called set.

Might just have to forget about it. I suspect that the problem is in the firmware as some of the other functions are obviously not programmed as well. It also does something that a 28 does not do in that it cannot be left on scan mute hold (mute light flashing). When left on scan mute hold, after the time that the scan is set to resume it switches back to sellcall mute. I realise this can be changed but the result of that is after the time period has run out it switches back to different sates of mute depending on the 4 states programmed.

Obviously this must have all been programmed with the input from the original owner. As yours does things mine wont these must also be options that Codan can select depending on the purchaser. Maybe the original owner had no use for Beacon calling so that function was not programmed into the firmware along with the Audio signal level bar and the remote site temp.

Buggered if I know. Maybe there are just too many choices in life????

Thanks for your help and suggestions anyway.

Regards,

Malcolm Langley.

Which is very difficult to take in any format, especially in digest. Now I'm NOT pointing the bone at anyone as I am a major contributor to the problem. (Ok, when did you post last ?)

I can only claim forgetfulness, the immediacy of contributing and old timers disease. (Couldn't think of all the other excuses I have in my book :).

I try and reply to anything I can help with as soon as possible, usually while working on something....you know the way it goes. I could leave it for a few days and the possibilities are that it would get lost and some poor poster thinks "bunch of snobs" or words to that effect. But I don't operate that way, I'll dash off something to let them know that we're onto it :))

Lets take a quick look at why this list exists

For discussion of all aspects of outback radio use in Australia, Royal Flying Doctor and four wheel driving emergency Communications
For dealers, traders and owners to swap, sell, and buy new and used Codan communications equipment, services and software, and for users to discuss
use of and experiences of Codan products, and people who would like to learn a little about Codan Products before Purchase

That just about covers it. *groan*

So out of necessity some discussions are lengthy and some are quick one liners.
Like any good list there is a fair bit of good natured to and fro ing but essentially it's a useful list to all sorts of people. So lets not get tizzy over an OCCASIONAL blooper.

Unfortunately at the moment it's not occasional. What to do ?

I guess if Jim et al don't change their ways we could

a) Change our email delivery so that its easier on us (would that fix things?)
b) Move to NZ...but you'd have to find it first ...:))))
c) You tell me

So , Jim and Guys, PLEASE remember to schnip...yes I know its painful but

<content snipped>

Cheers

g'day folks,
My name is Daimo and i'm new to the group but I'm hoping that someone might be able to tell me what's what re. changing crystals within the older HF radio transceivers. Basically, I'm looking at buying an old set, a 7727 but maybe a later, and changing the crystals to 4x4 user group channels and such.
So, is the exercise of changing crystals as easy as opening the unit, locating the crystals for the respective channels on the set, removing then re-soldering in the new crystals? Any comments on this concept would be greatly appreciated.

Regards,
Daimo.

Hi Daimo. I'm afraid it isn't that easy. You see along with the crystals is a coil or two. These have capacitors to resonate them on the correct frequency, and usually need changing to the new frequency. The circuit must then be tuned. If its a 7727, you may also have to change the connections to the low pass filter etc. Now thats assuming that the xtal was a simplex frequency (the wirings different). Thats the basics. There's more good stuff :))
It is possible for a person with a handbook and test equipment to get by. But it's usually a learning curve, for example the coil slugs are easily broken as are the coil formers...not nice nor easy to replace with the average 1KW soldering iron.
Cheers

Jim,
Thanks for your reply buddy. That's good info! I'm not an elec. engineer (just a lowly mechanical engineer) so I guess I'll be taking to someone to get the crystals changed! Any idea on how expensive it is ot get 'em changed?

From: Matt
Topic: 3475 Message: 3480

That was another thing that Jim left out - at a very rough recollection, you are looking at around about $30 per freq (or is that per crystal?) - it is much cheaper to pick up an 8525 or similar era which is eprom driven and thus much much cheaper to change freqs. These go for around about the $400 to $600 mark (depending on how lucky you are, sometimes they are much more expensive). Add onto that the cost of an antenna though - the above price is generally for the radio alone. Fella I knew up in Canberra bought one and wanted to do the same thing - the rough cost was more than what he had paid for the radio alone. Ended up buying an 8525 from one of my mates and that has ended his problems of getting it re crystalled.
I guess in summary, don't waste your money on a crystal radio unless you pretty much get given it or it already has all the freqs in it that you need.

Matt

Subject: Re: [codan_outback_radio] older radio sets

Jim,
Thanks for your reply buddy. That's good info! I'm not an elec. engineer (just a lowly mechanical engineer) so I guess I'll be taking to someone to get the crystals changed! Any idea on how expensive it is ot get 'em changed?

Jim <jimshire1@...> wrote:
Hi Daimo. I'm afraid it isn't that easy. You see along with the crystals is a coil or two. These have capacitors to resonate them on the correct frequency, and usually need changing to the new frequency. The circuit must then be tuned. If its a 7727, you may also have to change the connections to the low pass filter etc. Now thats assuming that the xtal was a simplex frequency (the wirings different). Thats the basics. There's more good stuff :))
It is possible for a person with a handbook and test equipment to get by. But it's usually a learning curve, for example the coil slugs are easily broken as are the coil formers...not nice nor easy to replace with the average 1KW soldering iron.
Cheers
Jim

Yes - naughty me, I must remember to snip snip - I am often guilty of it myself - really wish that yahoo wouldn't add all that crap into it at times.
Anyway, cheers to the group for the next week or so - am departing Melbourne for Darwin later in the morning, so will be away from the net and dependant soley pretty much on the Codan on comms whilst enroute, oh plus the UHF CB and the amateur bands - for those permitted to do so, catch you on the 15 m travellers net as well. Will also be on theVKS737 scheds - the way that I have set myself up with scheds, reckon I will be spending more time on the radio than looking at the scenery, ah well, I will load myself up won't I.

Cheers

Matt

To everyone,
Jim took responsibility for the emails that did not have the tail ends cropped yesterday. It was not fair that he should do that as the emails were all from myself to the group. I had problems with the 8570/ 8571 I was installing and I was trying to get help for this. I always leave the last message I was responding to on the end so if someone is wondering what I was talking about they could scroll down and see what it was all about. Obviously this does not suit other members and I therefore apologise for this. So in response to the email below I have decided that I are going to back out of the group for a while.
If anyone wants my input they can email me off line.
Thanks everyone on the group who has responded positively to my queries and thanks for the help given. I wish you all the best for the future.

Regards,

Malcolm Langley.

The bats seem to go up and down the outflow, and I was unlucky enough to be there 1 year when they were around the springs. Every night at 5 there was a helicopter tourist flight . For some unknown reason the bats all went to the loo as a group as the machine went over them.
However, the setting was relaxing, the drinks cool, entertainment was constant and the trees gave heaps of shady camping spots. More importantly to those on the road perhaps was the fact that everyone was friendly.
Cheers

I agree with Jim & Dave, Don't go Malcolm.

This is a tech type group & as such one can & should expect to have long posts from time to time. I only look at the web site & do not get emails as I would get too many from the ten groups I am in. If you cull all but the last response that you are yourself responding to then that should suffice.

If this is not the case then The List Owner should respond & state what is expected.

Cheers
Wayne

I agree with Wayne etc.Don't go Malcolm. And a I have a couple of points.

1) Malcolm and I took most of the 8570/8571 discussion off group. The only bits on the group are bits that may interest other members re technical problems / workarounds. Therefore we can be contacted offgroup if any further info is required later if the message index's are searched for a specific item.

2) The amount of bandwidth saved between individual messages and daily / weekly digests is minimul. Actually sometimes in an individual mail the YAHOO advertising is more than the message.

3) I haven't seen to much input from Brad who started the whinge. Is this another sandbagger who wants to bag people who actually use the group for what it is supposed to be for.

4) The fact of leaving all the posts in the reply message is a little large sometimes, but you should see some of the other groups, upto 11 inlines is what I've counted so far! Also the headers put in by some list establishers on all messages is beyond a joke.

So in the end, be happy everyone, this is not a perfect world so don't become a big POM (No racial slur intended. But it does work both ways.) "Persecute Other Members" .

My 2 cents worth. The idea of the group is so we can all SHARE information and problems we have come across. Not to blather on about the "DX being open now on 40 metres" or how many countries you have QSL'd! We aren't primarily Hams here, we just use or work with CODAN HF radios and so, as I said before, we SHARE information.

If I have overstepped the mark Jim you may TEP me (Terminate with Extreme Prejudice.). :-)

Sam

OK
Firstly I am saddened to see Malcolm leave the group. His input has been valuable and will be missed. Perhaps those who know him better than I will persuade him to return soon.

Regarding the trimming of messages etc. I have said it before and will say it again.
Please please please trim any non relevant crud from you postings. You do not have to delete the original message, but remove the 'yahoo' headers and footers. I think only the last message or two in a thread needs to be kept if it starts getting long.

While offtopic postings are not forbidden, please keep them short and sweet and trim them as well.

Yes we are all guilty of this, myself included, so lets all try and keep it a happy place to be.

Ben Hobson

(snip)

Assuming the coils are intact and in the frequency range, only need
to chang xtal and 2 capacitors, tweak 2 colis.
Finding coils would require finding a scrap radio and recover the
coils.
Assuming takes 30 mins per channel ill say a total cost of $50 per
channel. (total parts and labour back yard techo eg me :))
You can do it yourself for about $25 for a xtal and $2 for 2 caps.
You could do a tune up with no test gear just tweak coils for max
noise on RX, then check TX out coils are resonate for both TX and RX
function. if got a power meter/swr meter peak for max TX out
But i would recomend some test gear: RF voltmeter, Power meter, HF
siggen, Dummy load.
Any keen electronics hobbiest or radio ham can easy do a channel freq
change.
I would recomed anyone not with the above should seek some advice or
get a techo to do the work.

Regards

Ben and Jim - Well put.

One complaint from someone who has never offered assistance should not result in a valued member of the group (who provides excellent input) leaving the group.

I am not saying that the complainant should not post, but just that the result of that complaint would result in that person missing out on a lot of advice in the future.

Ben's words make sense, and I reckon that that should be the last of it, and that Malcolm should not feel the need to leave.

BTW, there has been an awful lot of off-board email going on between Ben, Jim, Malcolm and myself (among others), so the volume of traffic on the Group is actually a lot more than you see in weekly digests.

My $0.02 worth - Malcolm, please stay.

Chris

Frank I think you left out one tiny bit. If the new frequency is radically different to the old one, there may be some adjustment necessary at the driver/pa stage. Depending upon the model (7727/6924 etc), this may be a matter of changing the bandpass filter range. However with the 6924's it can be a matter of retapping the final coils to achieve maximum output. A fair bit of fiddling.
For the first timer without the test equipment and resources all this can be time (and money) consuming. And I'm assuming that he has a surplus of time and a manual to start with.
Believe me, you will learn more about your model radio than it's healthy for one man to know.
It's a bit like a mechanic saying that to change an engine it's just a matter of "chucking her in". Which,to a machanic, it may be. To me it's the equivalent to climbing Mt Everest.

Cheers
Jim

Subject: [codan_outback_radio] Deep, deeper, deepest ?

My creative friend is at it again. Only he/she could describe a 7727 as being for "deep outback" use. So I'd assume that an 8525 would be for a "deeper" outback use and a 9323 being for "deepest" outback use ....and an NGT as being for space walks ??
http://cgi.ebay.com.au/ws/eBayISAPI.dll?ViewItem&category=3308&item=5725158995&rd=1
Now the 7727 was a good radio, but ....!
Geez, hope it's nobody on this list :))

Cheers
Jim

radically different to the old one, there may be some adjustment
necessary at the driver/pa stage. Depending upon the model (7727/6924
etc), this may be a matter of changing the bandpass filter range.
However with the 6924's it can be a matter of retapping the final
coils to achieve maximum output. A fair bit of fiddling.

yeah jim,
indeed the PA output filter freq range need to wire up to channel
switch for 7727 and the relays for the remote 7727.

Jim,

totally agree with you not to mention the selcall controller is a
8222 unable to use 4 digits and did not mention hey you need a proper
antenna and base, really making positive spin on the product.
wounder what price will he sell this time for.

" along with the crystals is a coil or two. These have capacitors to resonate them on the correct frequency, and usually need changing to the new frequency. The circuit must then be tuned. If its a 7727, you may also have to change the connections to the low pass filter etc. Now thats assuming that the xtal was a simplex frequency (the wirings different).
Thats the basics. There's more good stuff :))
It is possible for a person with a handbook and test equipment to get by. But it's usually a learning curve, for example the coil slugs are easily broken as are the coil formers... "

Too true Jim,
Still working on the Lunchbox I got from you....along with 2 others...seems I can't resist a bargain.
Having a lotta fun tho
I am learning more about the 6924 than is good for my health probably.
Cheers,
Terry

Hi Martin,
While you're over here in New Zealand, (presume you'll be landing
in Christchurch) well anyway before you leave Christchurch, I would
suggest that you pay a visit to the base for the group that I belong
to The CANTERBURY MOUNTAIN RADIO SERVICE see our website...
http://www.mountainradio.co.nz for more info about our radio system.

Location = corner Montreal & Walker streets (Whites Sign Service)
Person to see = Mr Paul White (cellphone +64-21-365-618)
Times he is there = Mon - Fri, 08:00 - 17:00.

Best wishes,
Lou Lovegrove,
Base comms operator.

I'll answer these points as they appeared:

>2) The amount of bandwidth saved between individual messages and daily /
>weekly digests is minimul. Actually
>sometimes in an individual mail the YAHOO advertising is more than the
>message.

I wasn't interested in saving bandwidth, merely the length of the Digests as received required miles of Scrolling through often repeated messages searching for the new input. No names were mentioned as almost everyone on the group is guilty of this practice and it's been that way for ever, as far as I can see.

Other groups, ie the HFPack group, automatically publish a monthly reminder to cull the extra info. That might be a useful practice here.

>3) I haven't seen to much input from Brad who started the whinge. Is
>this another sandbagger who wants to bag people
>who actually use the group for what it is supposed to be for.

I have been servicing Codan Aviation radios for over 20 years. We also install the 9323 in various VFR aircraft. I'm here to learn just like everyone else. Thankyou for the slur.

>4) The fact of leaving all the posts in the reply message is a little
>large sometimes, but you should see some of the other
>groups, up to 11 inlines is what I've counted so far! Also the headers
>put in by some list establishers on all messages is beyond a joke.

My point exactly. It happens here too. I often see 8 or more Yahoo headers or tails before getting to the next message. So why the argument?

From Wayne:
>If you cull all but the last response that you are yourself responding to
then that >should suffice.

That's all I was asking!

Brad.

Not for a while, we are now going through CUG satellite installs in some units but we won't be pulling the Codans out as there are a couple of things us RF "Bush Blokes" consider important.
1) Never put all your eggs in one basket. What happens if the SINGLE satellite handling the network:
a) Fails due to battery failure, OMS (Orbital manueverinf System) fuel failure or explosion, Solar panel failures etc.
b) Gets hit by space junk or some millionaires sightseeing rocketplane (Sorry Richard, you are a bloody good boss to work for, but honestly "VIRGIN GALACTIC"!!
c) The RF absorbtion of very heavy rain during a Cyclone here in the tropics isn't considered.
2) The people putting the system out isn't us RF guys, it's the wireline blokes down South! They didn't even bank on any spare units or regional support. You can't just get
a replacement sat unit at the next intersection.
3) The planar array antenna's are more susceptable to bricks, star pickets, brolgas etc and not easy to come across.

Jim,
I worried when I saw a Wagner model 1729 100 watt pep unit pictured and he said:
"Here I have for sale is a very reliable WAGNER high frequency/ single side band CB radio in excellent condition and great working order has only been used once."

There was a model that used a 1729 or a c1-50 as a driver for a 400w and 1.2 kw land based and Marine set, similar to the Marine Codan units which have the finals removed
and are used to drive a 400w marine linear amplifier. But nowadays I think it would be worth $12.00 not what he is asking. Even if it comes with the linear it is old tech and parts
very hard to locate

Bit puzzled there Sam. The "standard" version of this connector ex
RS was used on the HF105. The 9323 version has the polarising
nothces 30deg displaced ref the pins (or vice versa). When I first
went to build a progging lead for my 9323, I discovered this.

I chased these back up the HiRose chain to a little lady in Japan,
who said the standard unit was in the catalogue but the "rotated"
variant was a special and not available through their distribution
network. Wound up cannibalising a dead 9323 mic for its
lead/connector in the end.

Don't have a Shinwa/Midland of that variety to hand, but just tried
an HF105 mic on two handhelds - a "Telemobile" (yankee thing marketed
here by Heyden-Spike) and an Electrophone - fits both. The Codan
9323 connector (obviously) doesn't.

Apart from the presence/absence of the centre pin, there are clearly
two variants in terms of pin pattern rotation vis-a-vis the
polarising bumps. I think what we ALL need to do is work out just
which units use what, and maybe that will help identify a source for
9323-compatible plugs/sockets.

On that basis, perhaps consider finding something that fits in the hole,
with the right number of pins, and source a more generic plug and socket
to suit.
Only downside is that if you get a new mike line or programming lead,
you will
have to put the generic plug on the end to suit the generic socket in
the radio.
Use of "Custom Made" connectors is a customer control technique to
ensure that you purchase replacements from the manufacturer of the
radio.
(Generally at an exorbitant price)

Radio manufacturers are not the only ones guilty of this, computer
companies
have been doing it for ages. Even has a jargon term, 'Connector
Conspiracy'....

Cheeky bugger! They were an infinitely better set than the
(functional) equivalent Codan - the 7727. Just like any HF xtal set
though, the fiddling with coils/caps each time you changed a xtal was
a nuisance.

;-D

In fact the use of "Codan" selcall won one of the largest contracts
for the HF105 manufacturer. The govt agency did not want to be
locked in to a proprietary selcall format, instead calling for an
international standard format. The HF105 (then known as the RFK105)
was offered with that. Codan missed out on hundreds of sales because
they were too inflexible to offer a version with the international
standard selcall format.

So to answer the question - no they weren't offered ex factory with
Codan format because (as I understand it) Codan threatened legal
action as it was "proprietary". But SC350 boards were available for
the 105 in either WA2 or Codan format.

Stirrer!

OK... could go somewhere average with that line, but I'll just mention that some thin wire, carefully soldered and 'shaved' (whilst not being the most convenient) will do the trick. Just poke them in the right holes..... plug it all into the PC and away you go!! Probably not the best if you're programming every day but for the 'casual user' is OK.

Hi again Jim,
We talked earlier about HF - I have decided to buy an 8525 since talking to you last. I think the reliability of the 7727's may not be as good as it once was and plus - even Codan themselves don't recommend buying a 7727 second hand! On the matter of antennae, I am looking and getting RFDS channels australia wide plus vks727. There is nothing especially important.

Jim <jimshire1@...> wrote:
Hi Daimo, sure several of them. What are your specific requirements ? Number of taps, whether they're 4wd network or RFDS or private etc will determine the cost.
Cheers
Jim

Yes the 7727 is a little long in the tooth now alright. The 25 is also old, but very reliable and a much better set IMHO. A decent whip will set you back around $450 from Terlin, plus a base and spring. Not cheap. However one Victorian ham club does a 737 5 frequency, I'm not sure about RFDS for around $150. RFDS can be contacted through the 737 network anyway.
Cheers

Another option is to look around for a s/h "Survivor" whip. They are good value and have everything you'd need on the taps.

Thanks for your advice Jim - much appreciated. This might sound silly but antenna winding doesn't seem like rocket science - have you heard of any DIY kits or guys winding their own on (say) fishing rods and the like?

It isn't rocket science, but it's close:))
You can make one up for a specific frequency fairly easily if you have an antennae analyzer, and the right materials. Making one that is optimized for radiation effeciency and bandwidth at each tap is another matter.
And you wouldn't want your marvel falling apart a long way from anywhere. A HF aerial can suffer a huge amount of knocking around etc.
I've got the correct test set up, and have used old mining whips and retapped them. I wouldn't recommend the process unless you have a lot of time, knowledge and patience. I still ended up with whips that worked well but looked awful.
If aerial manufacture was easy, we'd all do it. As I say, you can do it. But would you bet your life on the finished product ?
Cheers

3539. RE: 9323 Mic Plug

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-10-12 21:22:22 UTC
From: Brian
Topic: 3495 Message: 3539

All this talk of the elusive 9323 Mic plug got me thinking. I went back through some old notes I had and came across this. It was posted on the group by Tony some time ago (many moons ago) and I've enclosed the entire text of the email. It also has the details of the Codan Antenna anti theft lock nut.

"Graeme,

Call Peter James in LARA,(0418 599355) Victoria, He sells the microphone cable complete with the microphone shell as a spare part for the 9323.

For other readers he also has available an ANTI THEFT NUT to use to bolt down your 9350 autotune antenna. It has a free spinning collar that cavers the special nut so it is twice as hard to remove them. Much more secure than the padlock in the hole of the bolt.

Tony"

I'm not sure if the microphone cable complete with the shell includes the Mic plug on the end for the 9323 but a quick phone call would sort that out.

As for me, I tried for ages to try and get hold of a 9323 microphone plug to make a programming lead with. In the end I gave up and rang Codan. They of course wanted to know exactly why I wanted to buy another microphone plug. I put the thinking hat on quickly and told them that I wanted to wire up my own microphone with a plug on the end to act as a spare in case my microphone broke while I was away. $40 later and I had the plug in my hand and had made a specific programming lead for the 9323 that works like a charm.

There are of course a number of ways to program the radio by software. You can tack a couple of wires onto the back of the plug, make a programming lead (providing you have the specialised 9323 Mic plug), or you can possibly go to an extreme measure (I haven't looked inside the head for a while) and wire in a completely new plug to the 9323 plug and your programming lead and microphone.

The other option which might also be feasible would be to chop off the existing 9323 plug from the microphone and make a patch lead to a different type of connector for your programming lead and microphone. This way the head of the radio stays intact with the Codan socket and you have a patch lead to plug everything else into.

Just my 2 cents.

Brian.

..... Snip .. Snip .....

For temporary programming, why not open up the Microphone and solder to the wires there. It's a lot safer than sticking wires into the socket.

Countless decades ago I had an FT207R which used a strange Mic Plug, so I made a temporary plug. I ended up damaging the socket and had to buy a new one - and a proper plug. Is this off-topic ??? No, the Plug is almost the same as that used on the 9323 - and since I never throw out things that may be useful in the future (or JUNK as my wife calls it) I have now rotated the insides and I have a spare Mic Plug for a Headset for the 9323.

Brian some time ago I was offered some Codan gear at an attractive price so I went to pick it up in Brisbane. Visiting a friend beforehand I was warned that the vendor was well known as "Light fingered Larry" and had been in strife with the gentlemen in blue for his activities. I trod verrry carefully and was talking to Larry when he spied my 9350 on the back of the Cruiser. His eyes lit up and he said "Geez I'd love one of those. " As I left in a hurry (without the Codan stuff) all I could think of was the lack of security on the 9350. I've since rectified that(he knows where I live), but imagine finding out the reason that the aerial didn't tune was that it wasn't there. Especially if you only discover it out in the sticks. Another reason for forward mounting of autotunes ??

That's how I started out, but figured that sooner or later I'd get it
wrong, so eventually hacked an old mic cord. Codan's rep here in WA
quotes $33inc for the plug - never asked about a socket.

Jim,

Can't help you with the 8525...I don't think you can direct dial with the 25. With the 28, you need the correct version S/W..from the vaguest memory it was v4.3 and above and then you need to get into ?link setup mode and enable the set for Telcall. It's all in the manual I think.

When all this done, simply press the call button, enter the selcall number of the base station from which you wish to make the call then press 'enter'. The display should ask you for 'tEL No' and will allow you to enter the appropriate number...then press call and the IPC will do the rest.

Cheers,

Mark

for an 8528 hold number 3 and turn on, you can toggle Telcall on and off
if you are calling into and IPC 500 or a B.....tt interconnect they can
hold 97 speed dial numbers each allocated a selcall number 101 -197 these
translate to a prestored telephone number
You need to pre-arrange with the provider to give you say 5 prestored
numbers, but of course you can access all 97 to ring someone else's grandma!

Otherwise you can put a Jenal SC-2 Microphone on and have full telcall

There are also special keys on the phone
to toggle PTT / Listen if the kids are noisy in the background tripping
the VOX
99 to hang up
00 to extend the call etc

For the field set radios that we've updated here
in New Zealand, we have used the SC-2 microphones.

Where we have a security concern as in sets we've
placed in back country huts, then we've used the
SC-3 selcall only microphones. Both types will
allow anyone to selcall our base operators.

For the mobile HF installations we use Codan radios
with the SC-2 microphones. Excellent equipment.

Trust me, I didn't "find" one either - I called in a favour and a
certain dealer who had a dead mic sent me the plug plus about 6" of
cable attached.

Might just try Mike's technique on one of these spare 105 mics one of
these days. Will report back if it looks the goods.

Hi Guys,

I discovered the existance of this forum on the explore OZ site and given I'm looking at the possibility of buying a Codan at some stage thought it wise to join.

I've done a fair bit of remote travel in small groups with at least one of the group having a HF or satphone. One of these was always on the "desirable" list but up to now it's not been a financial reality.

I'm interested in options on the pro's and cons of satphone vs HF - I've read a fair bit already and am leaning towards the HF for it's ability to network with other remote travellers and it's obvious cost advantages.

I've three major questions :

1) Is HF an obsolete technology..? Is it likely to continue to be a viable medium for the next 10 years or so..?

2) What are the facts surrounding a comment I heard reguarding and application that Telstra is planning on running HF signals through it's network to increace bandwidth..? Is this a reality..? My understanding is that it will render HF radios unusable...?

3) What model Codan (second hand - with an autotune) seems to provide the best compromise between price and features..? Is there a resource I can look at which may describe the different models over the years...?

Many Thanks in advance,

Cheers,

Mark....

Hi Mark, welcome to the group. Just a couple of points to get the answers rolling.
First, BPL. There isn't really the local data availiable to be able to predict its overall effects. IF it gets up and running it won't be good for HF, but it shouldn't kill HF in Australia. However it certainly appears to have the potential to negatively impact many HF operations.
Much of the opposition is designed to stop widespread rollout of BPL here. For another view (NOT pro BPL) have a look at http://home.iprimus.com.au/jimshire/new.html , 25/9/04

For a better view of Codan models have a peek at http://ozradio.wireless.org.au/index.html

Cheers
Jim

Hi Mark,
Welcome to the group. I'm sure you'll get all the answers to the questions you have been asking.
The programmable gear from the 8525B onwards probably is the right way to go. The 8528 onwards have more features and more pretty buttons to look at. you can also program in and listen to radio stations which is real handy when you are in the outback with nothing local to listen to on your car radio.

Worst thing about the sat phone is that when you yell for help the guy who is 5 km away cant hear you and come to your assistance.

A suggestion for those who like to modify equipment.
why not mount a 2.5mm stereo socket in the side of the control head
somewhere as a programming port. Im sure it could be done easily enough
and be unobtrusive.
just a thought
cheers
ben

3569. No speak a da radio mate.

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-10-15 11:32:31 UTC
From: Jim
Topic: 3569 Message: 3569

Recently needed an easily read guide to the main bits for the first time user of a 4wd HF radio. Please feel free to modify, add or correct. Remember this is written for people who look at your Codan and say "what's that ?" Its not correct in a technical sense in several places...poetic license :))))

A few radio bits in "plain English "

Frequency...the radio spot where signals either are or aren't. There are around 3000 of em on HF but you'll only ever have to worry about a few. Frequencies are either in mega hertz or sometimes channel numbers are used instead.
Mega hurtz has nothing to do with pain. There was a movie made called Frequency.

Selcall. Usually comprises of 4 digits. None of em are an index finger. Selcall is used to call a particular station. So if you want to contact a mate and you know his selcall number, you just put his number in, press the selcall button and listen to those weird tones going out. If your mate is available you will hear your radio receive some beeps back in quick succession. Now you can speak to him. No tones received back , no speakada mate.

Receiving a selcall. Your radio will start to ring like a telephone. It can be startling if its your first ever selcall. Pick up the mic and speak to whoever is calling you if you haven't passed out or run off the track.

Beacons and revertive tones.
Most transceivers scan some frequencies. At certain times of the day and night, some frequencies are louder than others. Which one to use ? Lets say you want to speak to woop woop base. You dial up his BEACON number, like a selcall , and you can hear REVERTIVE tones from woop woop. Yeaaa, but he's so weak. Try all of woop woops channels (frequencies for the technical) and see where the loudest tones come back. BUT you will have to voice or selcall woop woop because the beacon doesn't tell woop woop that you're calling and want to yak.
Be sure you really want to speak to woop woops operator if you selcall. He's probably out driving a roadtrain and gets really mad if you put in his selcall instead of his beacon call and don't REALLY need to contact him.

Aerial Not tuned
Transceiver says "not tuned". Your auto tune is still asleep on the frequency that you have selected. Wake him up by pressing the tune button. He will love you for that and emit a couple of beeps. If he's a sick lil aerial you may get the lower really expensive beeps. That means he's staying asleep on that frequency.

Audio mute
Cuts the noise out when nobody is on

Selcall mute
Turn this on and you will hear absolutely nothing unless somebody selcalls you. Great if you just vant to be alone.
BUT you cant hear any distress calls or skeds. I hear noth ing .

So don't fiddle with this until you know what you're doing.

When you can hear your mate ok there's nothing worse than using the wrong phonetics, stick to plain English unless you have to spell something under noisy conditions.

Network skeds.
Memorize the networks sked times and don't selcall or have a convo over the top. Remember that just because you cant hear Perth doesn't mean that they cant hear you. And if someone you cant hear is in trouble. sooner or later so will you be.

At least listen to network skeds. There may be a message from Aunt Martha's executors and you wouldn't want to miss that, eh ?
If you're not listening you could also miss the weather, track conditions and any warnings. You might as well never have bought the radio if you don't use it at least once a day. Listen !!

Having a chat.
Imagine you are dazed and bloody and on your own. You crawl to the car/truck, in desperate need of medical attention. Try as you may, you can't call woop woop or the RFDS because of all the conversations going on about nothing important. Not so good eh ?
If you must chat, pause between overs.

Cheers
Jim

Hi Jim / anyone else possibly able to help. You say the HF400 - do you mean the HF4000 radio? Along with some mates, picked up some at an auction only to find that the cables didn't come with them. Consists of a control head, 200 watt amp and (from memory) a tuner although I don't think that we got them in the purchase. Very weird setup, but have seen almost no info on the web about information on them. Anyone know much about them (specifically would like to know more about programming them.

Matt
I read somewhere that an ham had a software program that controlled the Codan HF 400. Over your way I think Chris. Have a feeling that a few came up off the boats . What an enterprising chap :))
Cheers
Jim

Good evening all - back online on an occaisional basis (don't have my own phone line for a little while yet).
Quickly ducked into the springs on the way through and damn did the bats stink like all bejesus - thankfully didn't hang around for too long there. Radio performed well for the trip, so happy with that although still have no tune beneath 4 megs and am getting RFI to electricals inside cruiser around the 6-8 megs mark when TX on the 9350 on the rear of the cruiser (never had a problem when 8558 was on the bullbar). Got me stuffed, guess it will be time to put some more earthing straps onto it.

Matt

Topic: 3514 Message: 3577

Matt, congrats on you making the trip safely, and I'm sorry that the bats have obviously decided to stay. I know their smell well, takes a while to get it out of your system; but they weren't a *feature* while I was there.
Thats a strange problem you have with that aerial. Haven't seen one that wouldn't tune way down with even a half decent earth. I guess you've checked the earth with a multimeter from the coax socket on the aerial to the chassis.
That was the only info I had on the HF400 except I believe that they were a 24v set. I seem to remember that Ben knew a little of them ? I wouldn't mind one, all that extra power :)
Was yarning to one of my bros earlier about Darwin. He recently set up a warehouse there for his drugzzz (legal ones :) company and had a devil of a time finding a warehouse manager. He was told no worries....if you can take a backpacker :)) I guess employment up there must be booming....oh it's October, well maybe not :))

Cheers
Jim

3578. 9323 microphones

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-10-18 22:20:34 UTC
From: Graeme
Topic: 3578 Message: 3578

I have managed to source a number of 9323 DTMF lookalike microphones.
The only things that are different on these mics are the actual buttons
on the mic face { they were originaly built for the FM828). I have wired
one up to suit a 9323 but it appears the wiring inside is different.
The curly cords are the same (the yellow wire is surrounded by an
earth wire which is critical for command function } and the rest if the
wiring is exactly the same . The actual condenser micophone itself is also
interchangeable.
I have put a new curly cord and external backing on my mic where
the clip part sits. After getting a phone call there could be more coming.
Anyone interested in parts for there microphone other than the wiring
internals. Let me know

Graeme

Hi Mark, well there has always been a bone of contention between the sattelite and HF crew. In answer to your questions:
No HF is not an obsolete technology and it will remain as a usable mode of comms for many years to come. Whilst there is significant concern about the impact of BPL (as per Q.2), it will not make HF unusable although there will be significant impact to users in and around the more populated areas and to a lesser degree to users out in the bush. I guess that the extent of the interference will depend on how much the BPL proponents are able to influence the ACA's decision as to the removal of interference protection. If they are able to have the protection against interference by their systems, then the impact will be greater as they will be able to effectively cause whatever interference they want without any recourse available to us - although bare in mind that by operating our HF gear neartheir systems, we would be causing even greater interference to their systems. If it does become a reality, I (and I suspect many others) will be setting up as many beacons as I can on the amateur radio bands that I am licenced to operate on in order to carry out "propagation studies" which will effectively make their systems little better and possibly worse than dial up in my area. If they do go ahead with BPL and do not manage to have our interference protection removed, there will be multiple complaints made on a regular basis (to the regulatory body) about the interference that their systems will inevitably cause and they will end up having to either shut it down r otherwise put in place very expensive filtering setups that will have the same effect (will become too expensive to operate their systems).
As to a setup that is reasonably priced and a good performer, well I reckon that the 9350 auto tune antenna in conjunction with the 8528 remote head is very nice, although the 8558 auto tune antenna may be a better option for you as it is usually a couple of hundred dollars cheaper than the 9350 tuner (similar performance to each other, just the 9350 is much quicker to tune in). I paid about $1700 four or five years ago for the 8528 and 8558 combination, but I have since seen them as low as $1200-$1400 which is a very reasonable price to pay for a radio and tuner in good working condition. There is a bloke down near Melbourne who buys them off mining companies, cleans and checks them out and then on sells them - name of Alex from memory. They are not the cheapest to buy, but from personal experience, I can say that he has good quality radios and in the event of a problem, he has a form of warranty with them - I had a dud selcall board in mine and he sent up a replacement for it even before I had sent the old one back to him, so I was very happy that I had bought through him rather than some shonk who bought some at auction and was selling them off to make a couple of dollars. You could also look at the 9323/9350 combinations as I have seen some of these around the $2000 mark and they are a very nice little radio and also have other options available to them that the 8528 doesn't have - they are also younger so shouldn't have too many problems - one would hope.

Matt

Hi all around,
have (for me) new Codan X2 (9150) and programming
SW XP v. 3.0 30 May 1994
On PC side RS232 Pin2 TXD ,Pin3 RXD , Pin5 GND
On MIC socket side have try to wire programming cable like for 9323 :
Pin 3 Earth
Pin 4 Data to Transceiver
Pin 5 PTT/Data from Transceiver

No answer,
later with open case have find out that on X2 most probably
Pin 7 and Pin 1 can be for programming but fail again.

Before I continue with Try and Error approach like to
ask You guys for assistance.
All kind off Tips&Tricks are welcome

Thanks to a member of the list I've now been given the good oil on x2 programming. Many thanks.
I've also been informed that a number of 9323's minus aerials are availiable. These radios have some "interesting options" for licensed amateur radio operators.
The radios come from an impeccable source. (not me :))
So if you or a friend are in the market for a 9323 please email me and I'll pass you along the appropriate email address.

Cheers
Jim

3590. Proposed test

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-10-27 10:16:52 UTC
From: Jim
Topic: 3590 Message: 3590

Grettings fellow Codians (hello he wants something...again).
I have a need to check and see how well my aerial gets into various areas on certain frequencies at various times. Base beacons are useful but are limited to non mobile tests. At the moment I'm thinking of inviting anyone who'se got the time and facilities to give my selcall a buzz and listen for revertives and send me a brief email saying "Jim I was in woop woop, tried on 3 meg and nothing".
Advantages with this approach
All mobiles running similar power, setups
Can limit the days of the testing, say over a weekend.
Results are real world at a time when signals may or may not be good
Stations could call any time and it wouldnt take much of an effort
Mobiles could be anywhere

Disadvantages
Would put extra signals on already overcrowded frequencies (not good)
May inadvertantly disrupt more important stuff that they cant hear (but this happens all the time unfortunately)
Legality ?
Could clog up the airwaves (couldnt see enough people being interested for it to be a problem)

I'm sure my thinking is incomplete, and invite comments.

Cheers
Jim

Depending on the frequencies you want to try out, count me in (ableto use VKS-737, some other 4wd club freqs, amateru freqs, and RFDS. Currently located in Darwin, so not too sure that 3 megs will work to well (tuner still not tuning there anyway), but reckon that there shouldn't be a problem with about 5 megs and up dependant of course on conditions and time of day. 10m has been fantastic ove the last 5-6 days, but sspect it will shortly die down (unfortunately). Let us know with times and freqs that you want to try.

Matt

3593. Whippier whip

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-10-27 13:21:34 UTC
From: Dave Jones
Topic: 3593 Message: 3593

Hi all,

Quick question to the group. I have been thinking of making up a more flexible whip for the autotune.

I was thinking of a stainless bolt of the appropriate thread with a hole drilled through it, stainless wire or rod of the same length as the existing whip and tacked where it exits thread at bottom of bolt.

Has anyone done similar? I believe some of the autotunes came with a stainless emergency antenna, anyone know what length?

My other question is what diameter rod to use???

Regards

Dave

Dave,

There have been quite a few threads on S/S whips. I have a couple of pics in the photos section on the website. If you get an adapter made up (ie from brass/chromed) a low band VHF whip is quite suitable and relatively cheap.

I bought the Ba$%&#t whip some time ago before I figured out about the VHF whips and it cost a little much, but now I know!!

Mucking around with bits of wire just sounds a little too much effort for me, given the price of cheapo whips and a small spring.

Good luck,

Mark

Dave, the older Codan spring whip is 104 cm long from tip to tail. This includes the springy adaptor thing (where some break). The later one doesnt have a spring. So any whip around 1m long with an adaptor would be fine.
Cheers
Jim

There has been some discussion on that point but I believe the general consensus is that actual effeciency isn't all that different. The lower frequency tuning range may be (from around 2meg to 2.5 meg roughly).

Whip antenna vs monster whip.

I have done a few comparison tests between my 6ft fibreglass braided antenna and my 5ft S/S whip with an adaptor and I have found that there is usually around 1 S point difference for receiving stations at around 800km. An "S" point is 6dB difference in signal. - assuming that the receiving stations have calibrated meters - hi hi

Those tests were done with an 8528 and 8558 on a landcruiser from the same location at different times of day/night over several days on 3600 and 7080 with stations that I have regular contact with.

You can get 150cm Stainless steel whips from RFI - just fit your own antenna ferrule.

I have tried 105cm whips and I do notice the difference trying to work the above stations compared to the 6ft braided whip.

my $0.04

Kind regards

Paul

Firstly thanks for the interest people have shown. Very encouraging.
I'll be scanning all 5 737 frequencies , and invite you to listen carefully first and see how it goes. Not at sked times of course. Especially useful if you're out and about. (line feed)
I'll start listening around 1900 on Friday 28th (tomorrow night) through to Sunday 31st at 2400. Just a quick email any time letting me know how you went. Selcall is 4223.
TIA
Cheers
Jim

3608. 8528 not powering up.

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-10-29 09:56:32 UTC
From: troopy4x4
Topic: 3608 Message: 3608

People,
I am new to the group, only signing up the other day. I have had a Barrett radio for about 2 years, and have now picked up a Codan 8525a.
I am in Alice Spings and have had a quick chat to Ian B, this afternoon (now in Canberra) and he suggested that I try this group.
My issue is as follows:
I bought the unit from another subscriber to the group, and it was in a known GOOD condition in the box before I bought it. I have set the unit up on the bench, with a 7113B power supply, but I cannot turn the unit on. I have whipped the covers off of the unit and measured around the place on the power board and cannot find much power anywhere. I found that there was about 8.7V on 1 of the 10 pin connectors that go to the main logic board, and there is the 13.8V coming into the main power supply board, and have also found it at the 1N4001 (I think) near the +ve cable. I also found around 12V on one side of a resistor near this diode, but not on the other side. I have no voltage on the remote head connector either. I suspect that there cannot be too much wrong with the unit, but I am not sure where to turn from here. It also looks very hard to take the power board out for repair without de-soldering components, before removing the supply.
Any help has to be good help,
Thanks, Andrew Stephens.

to the main logic board, and there is the 13.8V coming into the main
power supply board, and have also found it at the 1N4001 (I think)
near the +ve cable. I also found around 12V on one side of a resistor
near this diode, but not on the other side. I have no voltage on the
remote head connector either. I suspect that there cannot be too much
wrong with the unit, but I am not sure where to turn from here. It
also looks very hard to take the power board out for repair without
de-soldering components, before removing the supply.
Any help has to be good help,
Thanks, Andrew Stephens.

Jim, Thanks for the quick reply. I just checked the 2 regulators. Both have 0V on all connections. I also checked the 2 fuses, both are in tact and both also read 0V. Also the 5V test point on the MicroProcessor board reads 0V. I am also in the process of downloading the manual.

Thanks again for the quick reply, Cheers, Andrew.

3613. 8528 fuse question

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-10-29 13:55:44 UTC
From: Dave Jones
Topic: 3613 Message: 3613

Hi all,

Not really related to troopy's question I don't think but in the Moaner's Annual for the 8528 I notice it doesn't recommend installation with any fuse other than the mains type BUSS fuse in the big black fuse holder.

Short (pun - oops) of the fact that the glass fuses of the mid 80's were utter crap and if you pulled 20A through a 30A glass fuse for any period of time it'd probably go open circuit as the solder ran out, is there another good reason for this?

Just to be different and to do the experiment I chucked the big black box in the "one day it might be usefull" box and did an installation with a quality blade fuse holder and a 30A blade fuse. Seems to work just fine.

Was it just a fuse quality decision? Cos those ceramic bodied fuses are certainly far superior to the glass 3AG's, but much harder to find at the corner garage. My thinking is that a 30A blade fuse is far easier to find.

Regards

Dave

I have had the same problem - twice - with an 8528. It turned out (tookme a while the first time) that the fuse I was using (a glass one) was faulty. It wasn't blown, but would not allow sufficient current to pass through to start the radioup. I also read 12v at the radio and all points along the circuit, but could not turn it on. Replaced the fuse and the radio worked both times I have had this problem and replaced the fuse. Not totally sure why the fuses have done this, but both times were in very high temperatures (the thermometer was reading over 50 degrees inside the cruiser) so I suspect that the heat was causing the fuses to fail.

Matt

Hi Troopy,

If you aren't getting power to the head unit then the power switch to switch the thing on isn't going to work to fire it up.

It's a bit like a tele being on standby but there being no batteries in the remote.

There's not necesarily an issue if you have voltage on one side of a resistor and not the other, it could be tied to gnd on one side and will read 0v regardless.

I assume you know a little about what you are doing, but here's a tip or two.

Use the main gnd where the power cable black lead feeds the board when it comes into the box as your ground measuring point and measure all your voltages with the positive lead of the multimeter with reference to there.

You talk of several voltages you have measured but it depends where you are measuring with reference to as to what you will read.

Once you download the manual check the test points as to what they read and compare with the figures in the manual.

Also check the integrity of the 15 pin D to D lead and make sure it is okay before doing too much else. Check the manual as I can't recall if it is pin to pin. If it has just one dry joint or broken wire your remote head may not talk to your Tx/Rx box. In setups that were working when uninstalled it is often something mechanical like a broken wire or dry joint that has failed rather than something like a fuse or component.

Regards

Dave

The story is getting better.
I downloaded the cct diagrams last night and had a bit of poke around.
I found that V2 (the 1st BC556, of the darlington pair) seemed to be
working ok, and was turned on, but when I checked the voltage at the
emitter side of V3 there was only about 2.2V. I will have a bit more
of a look today and see if I can replace V3.

Cheers, and thanks for the responses, this is such an active group

Andrew.

Some more info, as I have had a little more time. I replaced V3 on the PA and Filter board, but it made no difference. A bit more playing around, and I found that if I unplugged P1 from the PA and Filter board, then I had about 8.2V on the pwr on line, but with it plugged in, it was down to 0v. Ahh, the plot sickens. Checking the schematic again,reveals that this line would be grounded if the latching relay K2 on the mother board was in the ON position then this line would be grounded. If this is the case, is there a way to "reset" the latching relay. The manual says that you can ground the power off line and this will switch the relay, but as the unit is in the off state and the relay is in the on state, I have no "A" voltage present. Could this mean that the unit was in the ON mode when it was last unplugged, and this left the latching relay in the on state ?? If so, how do I "reset" this.

Thanks again for any input, Cheers, Andrew.

Hi Andrew, kinda hard to diagnose from a distance as you'll appreciate. Not having one open in front of me means I may be well off the mark.
Obviously all you should have to do is to get K2 the latching realay to turn K7, the power relay on. Unless something unusual is going on (and since it was working this shouldnt be the case) this is a fairly straightforward process. Momentary earth, V2 biased switching K2 which turns K7 on and applies power.
Are the 2 wire fuses OK.?...one of them o/c can produce your symptoms.
Cheers

Jim,
I am not at home at the moment so cannot try this, but I think that the latching relay is latched in the "on" position, which would drag the emitter of V2 down. Now the rest of the radio is not in the ON mode, so there is no Voltage at "A" and so earthing the power off line on the D6 line of the latching relay would have no effect, thus I was wondering if there was an easy way to "reset" K2.
Unless of course, I am way off the mark with my understanding of a latching relay. I have spent too long in the software industry, and not enough time of late in the hands on hardware stuff.

Cheers, Andrew.

Hi Andrew,
Don't think Jim is around at the moment, I haven't heard from him all day which is unusual.
He did have a virus in his computer last night which has given him a hard time.

I suspect from the way you are talking that you are trying or thinking too hard.
I suspect you have a pretty basic fault but you are looking too far into it to find it.
As you will appreciate it is hard from a remote position to identify a problem, especially if its a basic one and the set cannot be seen.

Have you tried the most obvious thing which is to connect the power to the +ve and -ve, measure the voltage to the main relay K7:1 using the -ve lead as the earth for your meter and NOT the case.
Next, ensuring that you have the battery polarity around the right way and only 12 volts connected. Connect the main power feed contact the relay K7:1 is switching to the other contact that it would be going to if the relay was to close. Sending the power out of the relay to the rest of the PA stage.
If the set goes then you have a problem in the overvoltage, reverse polarity, soft switch circuit. If it still doesn't go and no smoke is produced then power cannot be flowing in the main supply feed.
Would suggest you use a 2 amp fuse in the +ve line for testing and protection.

Regards,

Malcolm Langley.

Malcom,
You were on the money. I was over looking the problem. I went back and checkde the Codan bench power supply and the unit has 2 outputs. One is a 15.3V output and the other a 13.8V. Guess which one I used ?? I re-made the connector for the other output, and lo and behold, the unit sprang to life. !!!
I was right on one thing though, the unit was unplugged in the on state, as it came to life as soon as I plugged it back in again.

You guys are the best, you have saved me a lot of time and effort, and most likely $$ as well.

Cheers, Andrew.

PS: Perhaps you may hear me on the radio at some time ..

VKS737 November 420 ... Selcall 4200

Andrew, it's easy to do. I've done a few and my natural instinct is to panic when something goes wrong, get out the test gear and circuit and start sweating. However I have discovered what all good techs seem to know from birth, the best course of action is a coffee or smoke or whatever and an "intense visual inspection". Otherwise you end up running around like a chook. (from lots of experience:). Sometimes just leaving it for a few days will achieve the same thing.
I had a customer give a power supply back because it wouldn't provide enough go juice for a small amateur tranceiver. Guess which output he had it on :))
Congratulations on finding the problem, and thanks to Malcolm fand others or being there when I couldn't .

Cheers
Jim

I have come across some more 9323/9350 combos from a well known dealer. This time I can state that price is $1800 +gst+ freight from across the other side of the "beach". If anyone is interested I can pass along contact details. (and you don't even have to bid on em :)

Cheers
Jim

Hi Andrew,
I find that it often doesn't make any difference whether the radio was turned on or off when it was unplugged. The spikes in reconnecting the power will make it go into whichever state it wants to.
Glad I could help, where do I send the bill ???? :-)))

Malcom,
You were on the money. I was over looking the problem. I went back and checkde the Codan bench power supply and the unit has 2 outputs. One is a 15.3V output and the other a 13.8V. Guess which one I used ?? I re-made the connector for the other output, and lo and behold, the unit sprang to life. !!!
I was right on one thing though, the unit was unplugged in the on state, as it came to life as soon as I plugged it back in again.

You guys are the best, you have saved me a lot of time and effort, and most likely $$ as well.

Cheers, Andrew.

Guys,

Just another take on a similar situation...

Recently my 8528 would make the most horrible 'screeching' noise when I tried to send a selcall or just tune the antenna. It was very loud and had that sound that one instantly thinks the worst (ie.$$$$$$).

The set is running from an old 7113B Poweer supply. I soldered the power wires form the 28 to the old original Codan plug, so that it fits in the unmodified power supply plug.

Like Andrew's problem, I soon had the covers off and the service book out and lots of head scratching...even the odd swear word! Then a little birdy thought...start at the most basic...then work up to more complex reasons...bottom line was that I found the solder joint on the -ve terminal of the power supply plug had come loose and was 'just' touching the plug's pin...therefore insufficient contact to allow the full power of tuning or selcall. Resoldered properly and problem solved.

I never knew that my Codan could make such a spine chilling noise...especially from something so simple!

Cheers,

Mark

On that note I was still having trouble with mine tuning at 11 Megs. Above and below was fine if you remember my original posts.

Jim you suggested the impedance mod - changing the links. I finally pulled it off again (such a pain in the ar...) and made the change.

Result - tune and beep beep! (Much better than the previous burp burp which may or may not have been the failed tune noise....)

Now it won't tune on the AM CB frequencies but who really cares about that. It tunes on all others. (I added an earth strap too but that didn't fix the problem, the link change was required.)

Anyway, thought I'd let you know.

Dave

My puter is down again, some sort of exotic boot or memory virus. Both harddrives are sus, so if I promised to do something (eg pay money) to you this week and haven't, you know why it hasn't arrived yet.
My sincere apologies, all the files I usually print havent been done because of the virus. And yes I'm on the wife's puter :((

Cheers
Jim

Topic: 3631 Message: 3655

Hi,

I have just bought an 8525A with an Autotune antenna (d-series but one of the first). The 8525 has a remote head but no selcall. Our intention is to use this radio for emergency calls only (and hopefully never to use it for that). Radtel etc is not necessary.

There is a remote head with selcall for sale on ebay:

http://cgi.ebay.com.au/ws/eBayISAPI.dll?ViewItem&rd=1&item=5729039769&ssPageName=STRK:MEWA:IT

Would this be a worthy upgrade to my radio and what do you folks think of the price. I'm new to this so any advice is greatly appreciated.

Thanks,

Alan

Hi Alan,

Maybe try and get on to an 8528 head for greater flexibility, but if that flexibility (knowing what freq you are on without carrying a list) and RadTel type activity down the track isn't important then maybe this or similar is for you.

My $0.02

Dave

Oh and ask if it comes with the Selcall circuit board for the Tx (it's not much use without it) or see if someone here on the list has one. I'm not sure what is involved in fitting them, or if there's any mod to be done on the 8525 to use the 8528 head.

A 8528 head will not work with a 8525A body, But then again, even with a 8528, if there is no selcall PCB fitted to the transceiver it will not work anyway. To change a 8525B into a 8528 also requires an EPROM change.

LOL, it's my second, I had a 74 some years back when I lived in Leigh
Creek.
It was a ragtop and a PITA in the dust. This one is a hardtop and much
better
dust sealed. But it's as solid as the first one I had.
Bit heavy on juice, almost a light truck in some respects, but you won't
break
anything serious easily. Virtually all the panels are flat steel, easy
to fix.

> I learned NOT to drink any
> milk before I went on any bumpy roads...lest I be foaming at the

Yeah, it's a hard ride, all leaf springs. Not the best for extreme off
road,
but good clearance and it will idle in low 1st all day without a
problem....

> Ahh the Land Rover isn't that bad after all!!!

Oddly enough, I like them too. You just have to accept that if it's
British
it leaks.....

There's not a lot to it. My attraction to these is based on their
solidness and simplicity.
I had a 74 model some years ago...

There's enough room in the engine bay to get *in* there to work on
things and everything
is easy to see and reach....

A bit heavy on juice, but I don't use it everyday, so I can live with
it....

Geoff in South Oz.

Bit heavy on juice ? I had an FJ55V (petrol Landcruiser) that got 5mpg in the Simpson courtesy of the extractors and Holly carby. Was far too quick on the road for its brakes and steering. That trip was when I learned that if the other blokes only got a UHF CB then your HF isn't any good for talking over a sand dune. Mind you I didn't set out to travel with others but that's another story....
Cheers

Alan, the selcall option for an 8525 consists of three bits. There's a board that has to be installed in the radio, a thumbnail switch assembly that has to be installed in the front panel of the remote head (or local) and the selcall option has to be enabled on those frequencies that you use. This is a software programming operation.
Not simple,. not cheap. But well worthwhile in the event of an emergency.

Cheers
Jim

> Bit heavy on juice ?

Well, these days 14mpg around town (and it has to be LRP at that) is
considered a bit
heavy.
(Though it gets a lot worse than that in heavy 4WD stuff)
Compared to the 1600cc Proton Wira and the Honda CX500 I usually
drive/ride it's VERY heavy.....
Mind you, I can hang as many radios as I like in the Nissan without
upsetting the YF.
She tends to get annoyed if I hang a lot of extra bits in 'her' Proton,
particularly if it's
the size of an 8525 non remote head radio.....

Actually I'm decided to keep the 8525 for something else, I've got my
last working 7727 remote head unit in the Nissan...

> I had an FJ55V (petrol Landcruiser) that got 5mpg in the Simpson
> courtesy of the extractors and Holly carby.

Yep, I believe you.

> Was far too quick on the road for its brakes and steering.

Pretty much applies to the Nissan as well, it will wind up (very
noisily) to around 140kmh or so.
Definitely not safe at that speed if anything untoward happens....

> That trip was when I learned that if the other blokes only got a UHF
> CB then your HF isn't any good for talking over a sand dune.

LOL. In ATC we used to refer to that as 'frequency separated'.

> Mind you I didn't set out to travel with others but that's another

you could always buy a 4WD,then you might be interested.

and hey you might know the answer to a Codan question being asked by the owner of a 4WD.

maybe you could just not read any of the group emails.

sometimes people drible on all sorts of topics, that is just the nature of these groups.

one of the other groups I am in has set up a second group just for the OFF TOPIC chit chat.

it will take about 10 minutes for the group owner, or anyone else for that matter, then just tell the group it is set up and send the chit chat there.

```
to program, use a db9 and a codan x2
mike plug as follow:

db 9(9pins) x2 plug (7pins, clockwise,

7 in the center)

2-------------> 1
3-------------> 2
5-------------> 3

if not working, i think but not sure that the x2 pins
4 and 5 should be soldered together (or 5+6...).

Once done, just hold mute up while powering on.

Et voilà...
```

Ron, I'm pleased to say that I do own a 4wd and there is usually at least one Codan radio in it. If you wish to post on a topic that has even a small relevance to the group then go ahead. One of this groups strengths is the lack of rigid administrative notices from the moderators. Quite frankly, they're not really necessary. The groups generates a goodly but not excessive number of daily messages, and most are connected in some way to Codan radios. A quick glimpse of the archives confirms this.

Now we're all busy people who have a diverse range of interests. None of us wants to wade through 100 messages that aren't of any interest to us, and I see your point. But there haven't been 100 off topic posts on 4wds....yet :))

I'm as guilty as anyone for firing off a quick response. But with the group growing , and a small core of regular posters, it's easy to forget that it's actually a relatively large group.

Bogging the list down with a lot of administrative reminders would change the essential good spirited nature of cooperation and helpfulness that our members are renowned for displaying. But perhaps it's time for a reminder.

Guys when chatting please remember to put [Chat] or [Off Topic] in the topic line so that you can be filtered out or ignored by others.

Cheers
Jim

Jim,
Frankly I have never even thought of changing the subject line. My thought was that if someone was following a particular subject line discussion and it was all following along in the same vane, even if it did wander at times it is still what ties those people with that subject???? To change the subject line mid discussion could well make everything go of on a complete tangent and no one know where we are.

Example series of messages

8528 not powering up. subject 8528 not powering up
These are the reasons....subject 8528 not powering up
Mine didn't power up for this reason....subject 8528 not powering up
I had a different problem.....subject 8528 not powering up
What was that.....subject 8528 not powering up
When the motor of my FJ40 is running it causes interference..... subject 4WD (change in subject)
Many 4WD's are having that problem, especially with the new EFI motors.....subject 4WD
My Nissan doesn't do that, useless Toyota's.....subject 4WD
My Toyota has always gone better than anyone's Nissan.....subject 4WD
But at least I don't get the electrical interference in my Nissan.....subject 4WD
Hey guys, just solved the EFI interference problems, all gone, never to be seen again and my 8528 powers up every time now.....subject 4WD (forgetting to change the subject)
Here is what you do.....subject 4WD
Yeh, I just did it and it worked a treat.....subject 4WD

Then someone who hasn't been following the discussion comes in, deletes all the 4WD ones because they don't "have, or are interested in 4WD's" and asks a question like, "Hey, I have just bought a new CAR with an EFI motor in it and when I put my 8528 in I get all this electrical interference any ideas???"

I can imagine the next response would be something like,
"$%&#!&$^*#$^%!**^$%#!?><*&%$#!$%^&#**%&^ we have just done 20 postings on that subject, don't you read the postings to this group or something???????

Anyway, that's just my opinion. I read heaps of things in the group that don't have any reference to me, but who cares?, um, well not me anyway, that's just part of belonging to a group that has a wide variety of subjects and life experiences to discuss that all involve being in some form of outback, having a HF, emergency communications or whatever. People always have interesting things to say or experiences to relay or share with others even if it doesn't interest every single person. Hell, I have even been known to offer help on models of radio's or problems that I have never even seen or heard of before. I have never seen a 6801 in "real life" or a 9323, does that mean I shouldn't be interested or delete messages involving those subjects??? Heaven forbid I might learn something useful for future use that has no relevance today!!!!!

Regards,

Malcolm Langley.

Hi Ernie,
Great point, wish I had thought of that example :-))))))))

How about a supermarket that only sells the things you buy, not what everyone else buys as well???
or even better still,
As I only use diesel in my vehicles, a fuel station that only sells diesel would be much better, then I wouldn't need to drive past the petrol pumps to get to the diesel pump and I wouldn't need to wait in line to pay behind the people who are paying for their petrol :-)))
Anyway, that's all I will say on the subject.
Regards,

Malcolm Langley.

3678. Same radio, new saga - 8551C

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-11-06 07:41:51 UTC
From: troopy4x4
Topic: 3678 Message: 3678

After all the good work that you guys have already done, now I am faced with another problem. I have the 8525A all connected up, and powered, and all looks good. I have pulled apart and cleaned and checked the 8558 auto tune, and then I hit the tune button. Baarrp, Baarrp, Baarrp. Damm it ... This happens pretty much straight away, within .5 seconds. I took the autotune and the 8551 over to a mates place, and tried it there. The Auto tune works like a treat on his set, and I get the same problem as stated when I connect the 8551, to his set. So, I gather that the problem is with the 8551. I have download the files from Ben's page, but the .jpg compression has killed the schematic and it makes it very difficult to follow along. Does any one have a better schematic, or even better, seen the problem before and know the fix. BTW I was able to help him with his problem, that being not able to tune 8022. Ben's page comes to the rescue again ?? Onya.

Cheers, Andrew, Outback Oz.

Hi Andrew. Did you use the same lead with his set as yours ? Before letting the circuit out of the starting gate, I'd suggest something easier. Take out the multimeter and check the voltages coming into the 8551. They are labelled inside it. Also check to see that your coaxial lead is ok, it sounds a bit like there's no RF coming through the 8551.
Cheers
Jim + puter :))

Jim,
When I tried the 8551 in his, I used my cables as well. I have checked that all of the cables are connected correctly, and that the voltages coming in are ok. I guess 1 voltage that is a concern is the 5V out of the 5V regulator, it is down at 3.8V ... Something dragging it down perhaps ?? I have also checked that the coax is ok. In fact it is brand new ... although I did use his coax in the car. I have also metered out the cables from HF to 8551 (end to end) and from the 8551 to the auto tune (end to end).

Cheers, Andrew.

The low 5v was a furphy, as the input for the regulator is not applied until
the tune sequence happens. At this point, the 5v regulator is ok.
The whole tuning sequence is very short, almost as though it is not
detecting the RF, and then stopping the sequence ??
I will keep looking.

Cheers, Andrew.

Some more information. Just for a test, I removed the cable from the 8551 to the autotune and plugged that, directly into the Transciever box. So now the RF path bypasses the 8551, but the control cables are still connected as normal. Then I tried the tune again. There was no error condition (ie: no UT error on the Transciever), and the autotune still made the same clicking noise !! Perhaps the 8551 is NOT detecting a low RF ?? Now I am getting real confused. I am so rusty with Electronics, if you stepped on me you would get tetnus.
I think I need a break.

Cheers, Andrew.

Was the 8551 originally working ? The box detects swr and then tunes accordingly, apart from other functions. One quick test to see if everythings together is to put the radio on scan. This normally switches a wide band amp on inside the 8551. You can hear the results or check the voltages on the 8551. There's another thing, is the aerial working on receive at all ?
Maybe time to sit back and have a long slow look at everything :))

Cheers
Jim

The 8551 may not have been working before I got the unit, the owner had not said that it was. I have run up the scan mode and the radio scans the 5 freqs that I told it to. The scan line in the 8551 goes to 12v and the scan line on the output going to the autotune also goes to 12v. I hear the relay in the autotune click in, and it scans away. I think that it is working on Rx because, I heard someone try a telcall on 8Mhz and I can tune into the ABC (not too great a feat hear I feel). Perhaps I will turn on and listen to the Alice Springs sched from 4pm till 6pm and see if it really can listen.

Cheers, Andrew.

If it's receiving Ok , then that kinda rules the physical connections out. Do you know anyone with an SWR or power meter ? Then you establish if power was going to the aerial, and with an swr meter, whether it's actually trying to tune.
Cheers

One of your local ham or CB operators would be sure to have one.
It does appear at this stage that the 8551's internal swr bridge is saying "hey, no RF". This could be an internal or external problem as the bridge passes its findings to a "controller" chip.
Cheers
Jim

Topic: 3693 Message: 3693

Talking of tuners not working - after working fine for the drive up here to Darwin, my 9350 is now working intermittantly. When initiating tune, the tuner either fails to tune - i.e. tune fail as soon as the tune button is pressed, will timeout having failed to tune, or alternatively will achieve a tune. Seems to depend on how vigourously I shake the tuner when it fails to tune as to the result I get.
I am suspecting that there is a bad connection somewhere in the system - most likely around the tuner itself (given the changing results after shaking it.
The control cable is brand new (as of about two months ago) and the coax appears to be fine (I do get strong signals pretty much all the time).
What is the concensus - is it likely to be a fault with the tuner, or is it more likely to be a fault with the control cable?

Matt

Yep nice and tight ...

Ok to continue the saga ... I have checked that there is plenty of RF coming through, and I am getting full power. I also checked the BCD divider, and it is clocking ok. My next suspect is the LM324 OP amp. I am getting something out of it, but not much ...

Cheers, Andrew.

Andrew,
pin 8 of the LM324 pulls pin 25 of the micro low if there is adequate RF. Also is the 4MHz crystal doing its thing?

Matt Could be the flexible join between the sepper motor shaft and
tuning shaft. See Ben's site for details. That is the symptoms that we
get when units start to break down.

I seem to be the only member that hasn't contribute to this thread, so to stop me feeling guilty -

After using BNC's, it's hard to get used to PL259's -
- they only make a proper connection when screwed up tight
- they are not waterproof, whether loose or tight - if water gets in the plug/cable connection will quickly go high-resistance.
- they are not 50 ohm (or any other specific impedance for that matter !)

Mike

It may sound obvious, but are the PL259s clean and tight. Don't know why Codan, et al, insist on using them they are about as usefull as **** on a bull.

hi,
I am after a circuit diagram for a codan 8121 10 ch hf marine radio,
its a cross between a 7727 with built in tuner for random length wire
antenna,24 volt operation.

want to use a DDS with PIC micro and LCD display as a VFO.
coils cans tunded to 160 80 40 10 metres.

thanks in advance for any info offered.

Regards

Ryan, the unlock sig often comes along if the vco board has a problem. If you're a techie this is no big deal, as it is usually a matter of replacing several well known plain vanilla components.
Be aware that the 8528 isn't a supported Codan product due to its age, so any special bits that need replacing could be a problem.

Cheers
Jim

3718. 8525 and autotune antenna as a land base

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-11-18 09:12:06 UTC
From: Peter Mair
Topic: 3718 Message: 3718

Hi brainstrust

Had a call from the volunteer coastal patrol people who work from the Cape Byron lighthouse (Nthn NSW). They have an 8525 and matching autotune mobile antenna (is it 8550 ?) that they would like to set up in the flag house which is adjacent to the lighthouse itself.

My immediate questions concerned the earthing required in mobile installs and the EMR issue given this is in the middle of a public area.

Thoughts, ideas and suggestions ??? and any volunteer from the lower end of the Gold Coast able to take a run down to Byron Bay.

Thanks

Peter

Peter, normally I'd be happy to help em out, but can't at the moment due to medical committments. The obvious problem is putting the whip well away from anyone and at the same time having a good earth. No problem unless its some sort of protected site where you're not allowed to touch anything. A big goo gun might come in handy as the salt environment can kill em stone dead rather quickly.
Cheers

Peter,

Some friends of mine in Africa had a good experience with this one. They put a 9350 on a sheet of corrugated roofing, then extended a few radials across the (concrete) roof of the building. Great comms within country with the regular whip and contacts back to Europe at night on the ham bands using the long NVIS whip.

Hello Peter, we run a 9350 on a metal bracket screwed (With roofing screws without the rubber washers.) to the tin roof of our workshop for testing purposes and backup general comms when our landline remoted 9323 with broadband bushranger Dipole goes down (Telecom, ditch diggers, Cyclone damage.). We have no problem with comms over 3000klm depending on frequency and time of day but 10mhz to Roma and SEQ no probs at all during daytime ops. The earth cable is also crewed to the tin roof with another roofing screw with anti rattle (Fingered)
Stainless Steel washers. As the antenna is3 metres above ground and well in from the side of the building it is hardly noticed and RF radiation is less than if you where sitting in the front or rear seat of youe vehicle operating the HF.
Definately ensure all connections are well sealed with a layer of conformal rubber tape (scotch #26) then a layer of Black "Nitto" or high quality
brand insulation tape and then a good dab of silicone (UV proof) wouldn't hurt either. spray all exposed bolts and the base plates with an anti corrosion seling paint, like the blue stuff used on battery terminals by car service centres, as well as the earth connection. I always use "Contact Cleaner Lubricant" between earth points and antenna earths to provide a good connection not susceptible to corrosion. Always use a Stainless
Steel interface shim between antenna mounting bracket and antenna and roof to isolate dissimilar metal corrosion problems.
Oh and as you know I'm too far North for a quick trip :-).

Just going back over my E-Mail, and I find this reply ... sorry Techo ...

I checked on pin 8 and it does go low. Checked the rock, and that seems ok.
I re-checked all of my wiring from end to end and re-matched it to the doco.
All ok again. Next I checked the on board battery, and that was sitting at
3.3V. Seemed ok. Now looking at the doco, it says about the tuning that it
uses the last frequency that it tuned to as a ref. point, and then steps the
motor relative to that. What happens if it doesn't "know". How do you reset
the antenna to a known good point and then reset the 8551 to a known point,
so that all will line up correctly, this doesn't seem to be in the doco.
Perhaps this is the problem.
One more new thing that I found. If I press and HOLD the tune button, it
make the "I'm tuning" beeps, but the antenna doesn't, and then when I let it
go it says UT.

Perplexing ...
I am getting close to adding it to the land fill ....

Cheers, Andrew.

Andrew,
I seem to recall from an earlier post that you tried the antenna on another radio and it worked ok. If this is the case have you checked that there is voltage on the collectors of the 4 switching transistors (V9, 10, 11, & 12 BD675) and when tune is initiated is any thing happening on the base leads of these transistors. If nothing is happening on the bases is there any thing happening on pins 16,17, 18 & 19 of the micro.

Techo,
Yep you are right. I tested the Ant. on another radio and it was fine.
Ok checking the collectors on the V9 - V12 showed 12.3V during tuning, and for about 1 second after the error code. The base on V9 - V11 showed 0V, but V12 before the tune shows 1.4V, and during tune it goes down to 0.2V. The pins on the micro showed nothing either (with a DVM that is, I don't have acces to a CRO). If it is any help, when I press the tune button and hold it in, one of the relays in the antenna, just keeps on clicking. If you press the tune once, it clicks 3 times.
Rather odd, really.

Cheers, Andrew.

3728. 9350 check

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-11-23 07:25:52 UTC
From: Graeme
Topic: 3728 Message: 3728

Brought a Codan 9323 with an "A" model 9350 autotune. Installed the new antenna and radio and put it to use. Kept on getting auto tune failures and getting to the point of just about throwing it away but decided to try several things that the group here has discussed over a period of time. Started with the earthing of the 9350 itself on the vehicle. I ran extra counterpoise from the antenna to the vehicle and still got auto tune failures. Decided next to look at the antenna itself so checking on Bens website downloaded the pics of the internals of the 9350 and the following is what I found.

1/ The coax connection to the pcb was very loose so I crimped that a bit tighter till I was satisfied with it.
2/ I cleaned all the earth connections at the base of the antenna .
3/ Pulled out the whole assembly of the tuning section and found the following
a/ The spring at the top of the tuning assembly that sits in a recess just below the main external antenna spring just simply fell apart. Upon inspection noticed some corrosion. Cleaned and fixed that up and put it back in the top of the tuning assembly recess.
b/ The wire that goes up past the stepper motor (held by a quick tie just up from the stepper motor) and connects to the ferrite core assembly via a steel screw had a bit of corrosion between the connector and the ferrite core so cleaned that up and reassembled it.

Been testing it for the last couple of days under normal driving conditions and have not had one auto tune failure on all of the frequencies that I normally use. Even had better signal reports into Brisbane but could be frequency /propergation who knows.

So if ur auto tune is coming up with tune failures to often it might be worth while considering some of the methods I used. It appears to have worked for me

Graeme

Thats interesting Graeme. I have only had earthing problems, including the metal earth plate from the coax socket missing. I often imagine Ben sitting reading this list with a drink and a smile. If not take a bow now Ben, another success :))

Cheers
Jim

Sorri Steve
I live abt 2200 k north of you and the next time I visit Sydney is unknown. I do have a ham ticket to boot. I have found the Codan gear is good gear but do not be afraid to have a go. Do ur research before hand so you know what to expect and do the reverse to pulling it apart. Have a clean area like the lounge floor or the kitchen bench.

Thanks for the replies to my post last week. I have printed them and passed them along.

The Lighthouse Trust won't allow obtrusive antennas - hence the thought of using the autotune mobile. The roof install seems the way to go - thanks Sam for the detail in your reply.

To get round the antenna problem - they have remoted their VHF 16 and 27.88 via U-band links to a nearby hill on the escarpment. I know the NSW Amb used to landline remote their HF - anyone do this with a UHF link ?

Peter

I can assure you that in my case its something I wouldnt wish on anyone, especially a bloke :)). However it's better than suffering the stone. This is actually op number 2, and it may require more puter games before its fixed. Coupla days here, coupla days there. Tends to slow one down a bit, especially doing mowing and housework etc.
Hope the specialist has read all the TSB's, and has a good supply of spare parts. Come to think of it, he probably hasn't. I think I'm an unsupported product now :)))))))

3754. Radtel Frequencies

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-11-27 07:00:31 UTC
From: troopy4x4
Topic: 3754 Message: 3754

I have a need to put the Radtel frequencies in a radio, and I have these from the files section, however, on an old programming card it shows the Telstra RDD frequencies have different TX and Rx. Is this NOT the case for Radtel ??

Cheers, Andrew.

Andrew as far as I know Radtel do not use duplex so yes, the Radtel frequencies in the files are quite correct.
Cheers
Jim

Was writing a message in to this group last week when laptop hard drive gave up the drive. Since checking over the 9350 and cleaning up the inside , putting it all back together I have not had one aotu tune failure comeup. Even driving over the same roads here in central Qld the previously had caused all the problems. Worth the effort

Hey Malcolm,

That's a bit of a generalisation :o)

If it was a tapped whip he wouldn't have had a problem. :o)))

I move that the record be altered to be less prejudiced:

How about "Bloody lazy man's antennas...."

Jones Law #12 "All things with moving parts will fail eventually. Usually when it's least convenient for the operator....."

My 8558 will too one day fall into that category. I wonder how many autotune owners know how to make an emergency antenna.... not as many as own autotunes I suspect!

Hi Graeme,
Wouldn't say that, I have had whips fail as well. The RFI spring bases rust after a while and become less efficient due to the rusting spring, surface effect etc. I have also had the tips break off, lost tuning tips and had them fracture the winding by the mounting bolt. I would amend your rule to say "Anything man made will fail at the worst possible time" :-)))

Dave, I used to make them up and sell them. Sounds too good to be true, people actually paying for a bit of wire. But by the time you have put some plugs etc on em, info on how to use them and put em in a nice plastic bag it becomes uneconomic. The ones I made were for 8022 and 5455 (on the same aerial). I really should of stitched up a deal with ARB or someone I suppose :))

Cheers

There's still an amateur radio club in Frankston doing it and they are the best value for money tapped whip around. Search for Frankston & Mornington Peninsula Amateur Radio Club or FAMPARC .

I have an email address somewhere hang on and I'll dig it up ..... vk3ab@...

Alan is the coordinator. About $140 for all VKS737 and 10m (AM CB) Custom made or more frequencies extra but under $200.

Can't be beaten.

Yes they are a great alternative whip. I was talking about emergency aerials. In the event of an animal strike or rollover, the chances of having your whip base intact could be slim.
Cheers

Well yes - an easy way out is a spare bit of wire in the back of the cruiser (as well as a soldering iron, solder, coaxial cable {about 120 metres} and plugs - all of which reside permanently in the back of mine), but I have taken the even easier route (in addition to the workshop already being carted around) - I put the 8558 in the back of the cruiser when I retired it in favour of the 9350. Must remember to put the AD board in there as well otherwise it is a bit of a waste I guess.
Seriously though, it is very easy to make up a simple emergency antenna - and the best thing is that they work significantly better than the auto tuners do (assuming that you are near enough to a couple of trees to get the antenna nice and high in the air).
The formula of 300 divided by the freq in MHz and then again by 4 to get 1/4 wave lengths is a very handy one to remember. I would like to see an article in the VKS737 publication with piccies and everything so that the average 4wd people can easily understand it.

'Matts principle' worked well for me last year in central Oz when the tip of the helical ant got broken off by a low overhanging branch.

The hardest part was finding long enough piece of wire for 7Mhz. Eventually got hold of nice piece of copper wire twice the requied length (ex overland telegraph line - tied up on a fence line).

Just hooked it over a bolt that replaced the whip, did the bolt up, and secured the other end (of the measured length of wire) to the plactic shovel handle.

Rxd better signal reports on that arrangement for the rest of the trip than using the whip prior.

Also gave me an excuse not to have to get involved in the midday food preparation - as I set up the ant and made the appropriate calls.

Dave

The ones I used to build were 1/4 wave for 8022 and 5455khz. Banana plug and a plug on one end. Could be plugged into the radio direct or clipped onto coax. Then an open jumper to connect the extra length for 5455 and a piece of nylon rope at the end. Tested strung between an upright shovel and the vehicle. Excvellent results. Easily stored, just in case.
Cheers

3775. Cheap Selcall? Lunchbox

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-12-01 10:30:23 UTC
From: rangy92
Topic: 3775 Message: 3775

Hi,
Any one out there got a cheap selcall mike or selcall board. Needed for a backup (lunchbox) radio.
Cheers
Wayne

PS there is an Mk2 lunchbox on EBay if interested & no it is not mine.

Hi Wayne. The normal selcall board from a 25 or 28 wont work in a 6924 because it needs a micro to code and decode etc. I guess what you're looking for is an 8422 controller with an interface card. They work well with 6924's. Unfortunately I sold my last couple to NZ . The mk2 on Ebay has a somewhat "used" front panel, otherwise I would of bought it myself as I'm usually in the mk2 market.
Cheers

Hi Jim,
Yes my 6924 is working now & I have a nice braded rope antenna & a counterpoise from an old army 510 set to go with it. I have been told that a Barrett 250 selcall board will work as the smarts are on the board, just need thumbwheel BDC switches to set. Also that the old Codan units that used a DTMF mike also will work. Eg ex perthcomms. So testing the waters before trying your recording chips.
Cheers
Wayne

Wayne, cast a suspicous eye over those ex WA govt selcall units. Lots of em didn't use the Codan format that we use today. I believe the police used one kind and the councils used another etc. Glad to hear that the lunchbox is going well, I have one here that I put together from spares just to have a fiddle. I even have an original whip from the mk2 for it...its still sitting on the bench so that I can add a roger beep and scan board to when I get around to making them up....the roger board is closer.

Cheers

I've 'heard' that emergency services wont/try not to accept GPS data from most user stations for location purposes due to its variable reliability (eg accuracy of readings, datum differences etc). They preffer road/street names (just try and give a location to emergency services without that info - they really dont want to know about it).

Data was ws not an auithorised mode on the 4wd networks, dispite a push from the network operators. I guess it comes down to the possibility of an automated data transmission occurring over the top of an emergency voice transmission.

If GPS position reporting was so unreliable then Courier, Police, Fire Brigade Taxi etc would not spend lots of money on it and would not use it.

Of course people NEVER make mistakes when they give a Street or Suburb - do they :-).

Data Transmission is used all the time - a Selcall or a Beacon is Data - just as a GPS Beacon is a short data transmission. Data Transmission is even allowed on two CB channels - as long as it is only short transmissions e.g. Telemetry - but not email or Bulletin Boards !

They are all volunteers and if they don't want to do it, then fair enough. I believe "Our Lawyers told us not to use GPS" is an excuse they use to avoid the costs and training of setting up to do it.

I have seen demo's of GPS systems on the ham bands and it appears to work alright. Using programs like Ui-view it gives lat/long/asl/speed of vehicle and from memory even temp. other systems I have seen are from Modular Mining, a company in Tuson, stateside that his supplying the Australian mining industry but they pay millions for it. As regards the argument interfering with emergency transmissions that cud be fixed by dedicated frequencies for data only. In the ham fraternity GPS is taking off in a big way.

Dave,

I agree with your comments, with map datums there can be a difference
of 200mts between WGS84 and AGM66.
and there is a duty of care on the quality and the identy of the data,
maybe using the maritime HF DSC protocol (hf maritime selcall with
extra data for position), with a registed serial number or name of
user, being controlled by some central authority.

sounds good but not sure of the legals.

can try APRS on HF with a tiny-track TNC, using 30mts APRS freq if
your a radio amateure.

Regards
Frank

John troopy.
The news groups as I know them are like electronics
newspapers. They are a source of information on any topic you choose.
There are a lot of buy and sell type of topics. Another good one is
aus.offroad.cars I think The news groups are in the same program that
you use to get ur emails. By having a look at the path ur message came
down to the group contact ur service provider (westerndiving) or a local
computer shop and ask if they cud put or activate the newgroups in ur
email program It is not hard to do if u know what u r doing but a
nightmare if u dont

There are around 25000 newsgroups carried by my ISP (including aus.cars.offroad). If using Outlook Express have a peek at the "Tools" menu and then "Accounts". You will need to get the address (mine is news.iprimus.com.au) of your ISP newserver, and choose a password (spam bots trawl these newsgroups all the time). Once set up you end up with a file of all the newsgroups which you can then subscribe to. (no you dont have to pay :). Pick your favourite past time (unless it has 3 letters....if you do that you'll end up knowing more than one person should about .....errr...well just don't, OK ?) So if you pick radio, the groups that have anything to do with radio will be there. Be careful to only pick those that are in English...unless you speak Mongolian ..and Dutch...and Manderin..and ..and etc .
All the newsgroups have their own characteristics. Basically if you ask a question and get 10 replies then at least 5 will be useless to you, but if you're lucky some useful information can be had.
Cheers
Jim

Matt,
The formula etc has been run in the VKS newsletter on previous occasions but with no pics, I'am sure that it would be published if you would care to put the article together.

Mike

> The formula of 300 divided by the freq in MHz and then again by 4 to get 1/4 wave lengths is a very handy one to remember. I would like to see an article in the VKS737 publication with piccies and everything so that the average 4wd people can easily understand it.

3797. Re: GPS position recording

There are several reasons VKS do not recieve GPS positions the two main reasons being;

1: The incompatability of GPS systems between radio brands.

2: VKS frequencys are licenced for J3E transmssions, GPS does not come under this type of transmission. Tha ACA allow Selcal & Beacon calls under a J3E licence.

Mike you'll notice that in my original post I said networks plural. At least one 4wd network currently has email facilities via HF. This is a data mode and its a wonder that the 737 people haven't been licensed to do the same. As for GPS setup incompatabilities , there are procedural possibilities that could overcome them.
I just find it incredible that people are carrying gear that could possibly save a life, or hundreds of thousands of taxpayers dollars and people aren't "allowed" to use it.

Cheers

I'm sure the ACA has its reasons why it hasn't allocated data frequencies to the 737 mob. Probably sub section 3 paragraph 5 drafted by some clerk in 1901. I suppose that strictly speaking selcalls aren't really allowed either. After all its a data transmission thats "not allowed". The ACA isn't the only mob that have their hands tied by "the rules".

In a country where we work 3 months of the year just to pay taxes so that we can have almost every aspect of our lives regulated by the 3 levels of government, the lives of remote area travellers appear to be a legislative black hole. I know that you can't legislate common sense but .....

Each year we hire thousands of 4wds to tourists , many who don't have a clue. In some cases even changing a flat tyre is an alien concept as the motor club does it in their own country. Some of these travellers make it a long way from civilization. And most years some poor buggar makes the headlines. Many taxpayer dollars are spent retreiving others. So what an I suggesting could be done by legislation for hire vehicles ?
Compulsary fitting of
a) an underbody water tank
b) a pictorial account of where and how to use 4wd and the tyre changing gear affixed to the vehicle interior
c) an epirb with instructions in many languages (most importantly Japanese and German :)
d) a long handled shovel.

Yes it would be expensive to equip fleets, but the cost could be recouped by adding a minimum amount onto the hire fee, and as it would be an industry wide thing no individual mob would have to bear the extra cost. Just because I hire a 4wd in George St Sydney doesn't mean I won't end up in the Jardine.

I can well remember discussing these points with a QLD polly who had just completed an East West crossing via the Gunbarrel some years ago. (actually he was a party secretary, same stuff, different bucket) Needless to say he wasn't optimistic that such legislation would ever even be even considered. Unfortunately despite several coronial inquests that have indicated the need for such things, it appears that he was sadly correct.

And yet the council can legislate so that I have to do a course to inspect my own sewage system, the state can legislate so that my vehicle must be safe and the Federal Govt can legislate so that I have to pay more in taxes.

Oops, I'm in the Codan group not alt.govt. etc. Sorry guys, time to jump off the soapbox and get back to reality. Perhaps we could all sing "where have all the mounting brackets gone..."

Cheers
Jim

Topic: 3799 Message: 3800

Some good points Jim. Of course if VKS737 (and others) wanted to they could put a facility to decode GPS and users could transmit GPS data - in a life threatening situation. Three thing arise then:

1. in a life threatening situation you can use any frequency - would the same apply to using any form of transmission (i.e. GPS Data)

2. even if it was illegal, would you rather cop a fine or be dead???

3. it would not be illegal for the 4WD group to have a decode fitted as they are not transmitting anything (of course if you really stretched it to the stupid point you could possibly get them for aiding and abetting or some such thing).

If a decode was installed and found to be abused, the 4WD group could enforce the life threatening only rule by rescinding the membership (and thus licence) of those who abused the system and/or reporting them to ACA for action.

But all this requires a bit of initiative.

Howard, VK3DLH

Jim

Politicians won't support it - because tourists (especially stranded ones) can't vote for them. If you want motivation, you need to approach people who can profit from the change - manufacturers of underbody water tanks and EPIRBs (406 MHz with GPS ID beacon built in)

Folks,

There is such a system available, and I have been involved in the beta-testing.

It's a Web-based GPS tracking and HF SMS system that works both ways.

For example, all you need to do is to log onto the Web site and send an SMS message to a mobile.
The system then sends it as a pagecall, and advises you when it was received by the mobile.
The mobile can send *you* an SMS message, as well.

The GPS tracking works very well, and it is fun to watch people as they move around the country.

pjames@... is the email address for information.

Hope this is of interest,

Chris

> Some good points Jim. Of course if VKS737 (and others) wanted to they
> could put a facility to decode GPS and users could transmit GPS data -
> in a life threatening situation.

I can't see any reason why they can't have such a facility on a receive
basis now.
The license is needed to transmit data, you don't need any kind of
license to wire up
a TNC to a receiver and feed the result to a computer.
It's the transmit end that needs to be licensed.

Basically the rules say that if you are in distress (defined as grave
and imminent danger
and in need of immediate assistance)
then you may use ANY MEANS to obtain that assistance.
This means if you, say, start a smoky fire during a fire ban because you
rolled your vehicle in a forest
and you have a busted leg and your mate is trapped and bleeding to
death, you CANNOT
be prosecuted for breaching the no fire rule because you did it to cause
the fire spotters to
attend so that you could get help. You could with equal impunity damage
something (a
phone line or power line say) knowing that the authority would come out
to find the fault.
I don't think you can even be forced to pay for damages.

Current legislation is that the cost of SAR is not passed on to the
rescued.
(Consider what it cost to pull a yachtsman from the Southern Ocean a
while back)
Sorties by 4 engined military aircraft to find him and a long trip by a
warship to retrieve him.
I wouldn't even like to get the fuel bill for that.

> Three thing arise then:
>
> 1. in a life threatening situation you can use any frequency - would
> the same apply to using any form of transmission (i.e. GPS Data)\

"ANY MEANS" means just that. DC to Daylight. You could lawfully
hijack a satellite transponder to yell for help if you had the means or
deliberately
interfere with a commercial transmission to make someone investigate.
"Any means" is a very broad brush....

> 2. even if it was illegal, would you rather cop a fine or be dead???

If you are GENUINELY in distress (as defined above) it's not illegal.

> 3. it would not be illegal for the 4WD group to have a decode fitted
> as they are not transmitting anything (of course if you really
> stretched it to the stupid point you could possibly get them for
> aiding and abetting or some such thing).

If the unit was capable, as long as the GPS is not connected it
shouldn't be an issue.
Grey area though.

> If a decode was installed and found to be abused, the 4WD group could
> enforce the life threatening only rule by rescinding the membership
> (and thus licence) of those who abused the system and/or reporting
> them to ACA for action.

If it *were* abused there could well be repercussions for the licensee
of the equipment
as well as the perpetrator.
If it were used for a *geniune emergency* then there should be no
problem.
I'd also suggest that if such a system WERE used in a genuine emergency
and lives
were saved as a result, it could cause an attitude adjustment in the ACA
with a little
pushing and shoving. Remember that 27Mhz CB was illegal and the PTB had
no
intention of legalising it until pressure about it's potential to save
life was pushed.

> But all this requires a bit of initiative.

Indeed.

Geoff in South Oz

Then if this situation occurs and the person can initiate a call via the radio they can then read the screen of the GPS and give out the coordinates (mind you past experience proves this can have it errors), usually easier than trying to send them because most people in this situation have enough trouble sending selcalls without trying to send a GPS call.

Hi Jim,

you can order them through RFI , last time I bought a few they were about $7 each, I have also tried the usuall convienant outlets and they dont stock them. You may need to find someone with an account with RFI otherwise there is a Ham outlet in QLD on the web that is now a RFI stockist, cant remember the web address but they also do toroidal balun kits as well, someone else is sure to know of the address..

BTW , RFI also have 5ft tapered s/s whips which are a handy replacement for the Auto tune whips too..

Hope this helps

Paul

Hi Jim,
My unit is a Mk2 & has a new whip that was still in its shipping bag when I got it.

What about the selcall boards that used a dtmf mike as used in the old Perthcom units? I know where there is one that has Codan 4.5 marked on it. I belive they were the same as used in some early Codan sets. Can the earlt (4 digit) selcall units be reprogramed to the system we now use?

Maybe I should take a pic of my as new Mk2 for the photo section of this group.

Cheers

Hi Jim, there has been talk for at least 2 - 3 years about getting some data specific channels for the VKS737 network, but have heard nothing for a while. Would be a great idea and I have no idea as to why it hasn't occurred (the amount of licensing fees the network brings in is huge, so another couple of hundred bucks shouldn't cause that much of a problem should it?

Matt

Subject: Re: [codan_outback_radio] Re: GPS position recording

Mike you'll notice that in my original post I said networks plural. At least one 4wd network currently has email facilities via HF. This is a data mode and its a wonder that the 737 people haven't been licensed to do the same. As for GPS setup incompatabilities , there are procedural possibilities that could overcome them.
I just find it incredible that people are carrying gear that could possibly save a life, or hundreds of thousands of taxpayers dollars and people aren't "allowed" to use it.

Cheers
Jim

Have no problems doing writing up such an article, but feel that it would carry more weight if submitted by one of our older statesman - i.e. Jim (OK Jim, but you are older than me). I think the last one that I saw was in one a couple of months ago, so it may be better off waiting another issue or two before it is run to ensure that it gets the coverage that it deserves.
On a different note, interesting use for an 8558 body (URL may need pasting together):

Matt,
The formula etc has been run in the VKS newsletter on previous occasions but with no pics, I'am sure that it would be published if you would care to put the article together.

Mike

> The formula of 300 divided by the freq in MHz and then again by 4 to get 1/4 wave lengths is a very handy one to remember. I would like to see an article in the VKS737 publication with piccies and everything so that the average 4wd people can easily understand it.

I'd imagine that the real value of the system would be in either knowing a mobiles last position , or in being able to interrogate the radio to find its current position. Something as simple as a broken mic lead could end up causing search and rescue to activate otherwise. Thats assuming that anyone actually cares where you are or aren't on a daily basis.

Ok. I have taken the 8551C and put it in another fellas rig. Took all of the cables off of his and put it on to mine, same error. Ok, it is definately in the 8551.
Does anyone know how to "reset" one of these. I mean they keep the last set frequency in the RAM, but if you change AutoTunes ?? or if the battery to the RAM chip goes flat ??? I think that this MAY be the problem.

Cheers, Andrew.

You seem to be having a lotta problems with the 8551. I assume that you'vbe downloaded the handbook on Bens site, and so know that IC4 is placed in power save mode when the +5 is removed.
Wasn't the problem that it failed almost instantly ? Does the output of IC3 go high at turnon ? Is the backup battery ok ? Is IC5 giving the divided frequency output ?
Does IC6C 's output rise when RF is applied ?
It could be so many things. Very difficult to do by remote.
Cheers
Jim

Problems are an understatement. My wife is yelling at me now to "Get that damm thing off the table", oh well life's like that. Anyway ...

Yes I have the handbook from Ben's site, but the scematic is not a lot of good as the .jpg compression, is that small that I can hardly make out a lot of the writting, but it has been a real help all the same with all of the technical descriptions.
IC4 in power save, yep that is ok and the battery is providing the 3.3V that it needs to keep the RAM alive.
Yes it gives me an untuned after about .5 sec, which would indicate that there is no RF detected, but that is definately NOT the case, as I have checked this with a SWR meter, and I have also replaced the IC6. Stangely also, if you hold the TUNE button down, it does make the "I am tuning", but the AutoTune is not moving. As soon as you let go of the TUNE button, it gives the UT error.
The IC3 output seems to be ok, since the power stays on the rest of the cct for about 1-2 secs after the UT error.
IC5 is working correctly and giving the clocked output.
Yes IC6c's output also rises.

I guess that I have 2 issues. One is that I can't get much more out of the cct diagram, since I am guessing most of the components and their pins and values. 2nd - There doesn't seem to be any information on the reset of the RAM should you change the AutoTune, or if the battery does go flat and the RAM is zeroed out.

Cheers, Andrew.

Ah yes, it is a very good system but:
All GPS units have to transmit the data in the same map standard, there are currently in most GPS's:
AGD 66 (Australian Grid)
AGD 84 (Australian Grid)
WGS 84 (World Mapping Grid)
used in Australia and and extra "NZGD 49" used in New Zealand.
You also have to decide on decimal degrees or degrees minutes seconds.

They all will return different location data on your location.
We found this out during the recent SEQ Fires. We use AGD 84 up here in the north, Parks seemed to use
WGS 84 and some local users use AGD 66. Talk about a GPS aligment crowd on the forecourt of a fire station
when we had to get all the units to display the same home location! Much resetting of default parameters to the selected
standard only to find later in the day that the GIS software was set to a different standard! Fun.
We will be having GPS location activated on some of our remote comms gear WHEN they work out which standard
to run as default. It also depends on which maps you are referencing as well.

Sorry about the "BARRETT" shout but this group is about more then just Codan radios, it is also about all aspects of outback radio use in Australia, Royal Flying Doctor and four wheel driving emergency Communications no mater what the brand of set.

Yes I did take the Ba$$5** as just a shot in good fun.

I will take the pic's when I can & send them in.
Yes the autotune is a Barrett (910) & works well mounted on the back, not had a problem with it. I am making a longer whip for use as a "in camp" whip & will send details when done as it should work well on Codans as well. The emergency aerial is in case some fool wrecks there car by using my rear end as a stopping point taking the autotune with it or I run out of bird stoppers (whips) as they tend to break when used this way, even on Codans (radios that is not Codan birds). Note that Barrett 510/910's & maybe some Codan whip autotunes will not tune a long wire aerial. Also Barrett atotunes will run on any set (even Codans 7727's) with only a small mod to the set.

Not heard of a Barrett 2050 before.

I no not know anyone with a 940 or there resale price, sorry.

Cheers
Wayne

If I'm lost or injured in Central Australia, I wouldn't be at all concerned if the Helicopter landed 300metres from my position (that's the maximum difference between any of the Datum's in Australia)

Now that Australia has changed to GDA94 there no question as to which standard to use - it is virtually identical to WGS84 which is the default standard in ALL GPS receivers.

You left out GDA94 (which is horizontally coincident with WGS84 actually)
Some older/cheaper systems lack all or most of these except WGS84. WGS84 is the default.
If you are using GPS to drive moving map software, you can use WGS84 and the software can be configured to convert to whatever the datum of the loaded map is.
For remote reading of position, in an emergency system, it will be necessary to
decide on a default datum for the data, given that the default is WGS84, it might
be wise to use that.
In Oz, the error if you use the wrong grid out of the 4 mentioned to plot the map
position is not huge, ranging from effectively zero (WGS84 v GDA94) to several
hundred metres. So even if the datum is wrong, rescuers would have little trouble
locating you in a short grid search around the position.
However if you use a foreign grid by mistake, you might as well send random numbers.

Bear in mind that the inherent accuracy of the GPS system (without other error
correction) on the civilian accessible system is on the order of 15-40m. In practice
it can be much closer at times, but that's the average. Accuracy varies somewhat
depending how many SV's are in view and the geometry (how they are positioned
in the sky in relation to each other at that point) which affects the accuracy of the
spherical geometric solution that gives you your positon.

Choppers don't have the fuel capacity to be of much use in Central Australia unless you're lucky enough to be relatively close to a station at mustering time. They'd have to drop water to you so that you could stay alive until the land party found you. 300m is a long way with a broken ankle.
(The word you're loking for is pedantic:)))))))

Of course I meant looking for not locking for. If you had lockers you may not be stuck:)))
The matter of useage of different standards with GPS units interests me. As I understand it, if I send an EPIRB signal saying I've run out of beer (!) then it is triangulated (or whatever depending on the number of sats I guess), and my position sent down to Canberra. They then arrange for a relief/rescue mission. What map standards would they use ?

Doesn't matter. But a triangulated position from an EPIRB is less
accurate than a GPS position.

relay the position in some form of GPS co ordinates to the search
groups would they not ?

It doesn't matter since the information is a bearing and elevation
from the SV's to the EPIRB. The SAR people
then translate that to any map they like as a lat long or a UTM Grid
Reference, depending on who they are sending
it to. Ground parties would likely be given a grid ref to a datum
appropriate to their maps/equipment, or they would
translate the lat/long themselves. Heavy aircraft would get it as a
lat long most likely.

As I understand it, the sats give them a 'area of uncertainty' in
which the transmitter lies.
I'm not sure off hand how big that is, but given the long baselines
involved, I'd say it was several
kilometres in area at least. This is actually quite a small area to
search over water, and not much worse on land
Define an area somewhat larger than the area of uncertainty and
conduct track creep or grid searches in that until they pick up the
beacon in the aircraft,
then DF equipment on the aircraft can fly them straight to it. Once
the site is established, then
a GPS fix is made and a rescue party is sent to the fix.
The advantage the EPIRB has is that it's constantly transmitting until
it's shutdown or the batts fail,
which is around 72 hours. So a search aircraft sent to the area at
altitude would likely pick up
the signal at once and be able to pinpoint it within a fairly short
time, even allowing for transit from
a base. The sailors in the Southern Ocean were found within 12
hours, the Orion was sent to the
vicinity and tracked their EPIRB, sending a fix. Then a a warship
came and picked them up.

> Or have I missed something here ?

No, not at all, but the raw data from the sat can be translated into anything, that's what I meant by
'doesn't matter'.

We have the same problem here in NZ. 3 different mapping systems using 3 different scales. The one thing we do have is that the NZMS 260 series mapping system is done with the NZ standard grid reference system which has its own GPS configuration. It is used by all the SAR type agencies, DoC, police, hunters, trampers etc, so as long as you have your GPS set up for it everyone is talking the same language. The Gamin's can be connected to a radio interface and the data sent back over the air to the mapping program. This allows search teams to be tracked live time. it would work here no probs with HF and I don't think we would need to change our licences as we are sending data types of format already with all our selcall information already anyway.
Hmmm, I can see a couple of NGT's coming up :-)))

There are two types of EPIRBs available currently.

121.5 Mhz has no ability to send its position - satellites passing overhead deduce its position to the nearest few km and send that info to AusSAR. Personal EPIRBS are available for $240. The satellite tracking system will be closed down in a few years so only aircraft will hear this frequency.

406MHz sends a Serial Number so they know which EPIRB is transmitting. You can optionally connect it to your GPS to send your position to within metres - to ensure the hot-air balloon, dray or dune buggy sent to rescue you arrives in the minimum time possible. The GPS always sends WGS 84 to the EPIRB, even if you have set it to display another datum. These cost $570 now.

Hi Howard,

There is also the Barrett group as well. I'm sure it doesn't have the HF experience of this group, but there is always the chance someone might know more about the model number you are talking of.

http://au.groups.yahoo.com/group/barrett_hf_radio/

Brian.

Subject: [codan_outback_radio] Barret, actually

Friend in the UK has a Barrett 2050 portable coming his way shortly. He asks if it has been released in Australia. I have never heard of it and was wondering if any on this group have?

Also, as there really is nowhere else to ask, what is the going price on second hand Barrett 940s?

Thanks,

Howard

Do not most of the the new type 406MHz EPIRB's have there own gps built in? Or do some still come without & still use the Doppler shift as satellites approach and recede overhead to determin the EPIRB's position?

cheers
Wayne

AFAIK, the top of the range ones have an onboard
GPS, cheaper ones can have an external one connected,
the cheapest are just a beacon.

> Or do some still come without & still use the Doppler shift

Actually the SV's do the doppler measurement not the beacon.
The beacon is a (fairly) accurate frequency source.

It's the new radio that Barrett has been showing drawings of for at least the last 6 months, but not yet released to my knowledge.

I have a preliminary brochure somewhere.....

New epirbs: They also have an ESN and record the owner and contact details so that we spend less time looking for false alarms generally from stolen 121.5MHz EPIRBs.

By the way there would be quite some discussion about whether or not to come looking for you if all we got at our control room was a call from VKS737 or similar to say that they had a call from a radio that had a GPS location and not much detail on whether their had been voice confirmation of location and the problem. We'd probably bump it off to SAR - probably to VicPol and let them and the SES find you first.

Just my 2c worth. Even if I had a radio capable of doing it I wouldn't bother hooking my GPS up to it. The regional ambulance emergency services infrastructure in Victoria isn't geared up to cope with it's own ability to accept GPS location from it's own vehicles (the fleet has been fitted out) let alone anyone elses. And their GPS system is a feed back only system - you can't nav with it.

And even if they did get GPS coords they don't have the gear to reference them to a map location unless you get a controller who is into it for a hobby and has their own laptop armed with mapping software handy. Most of the time you'd be lucky to get one that knows the difference between lat/lon and UTM.

Unfortunately the technology in private hands in the last 10-15 years has left the ambulance service fumbling around in the dark. My personal electronic mapping and GPS setup craps all over the stuff we have at work. Beauracracy holds tight on the purse strings and the beaurocrats have a habit of lagging behind on these sorts of technologies.

The above is my opinion only and not that of the organisation which employs me - which you might note I didn't name...

- I assume this doesn't apply to our use of GPS info from a remote area. If I call VKS737 at midnight and tell them I turned off the Sturt Hwy a day ago and I'm now broken down at Lat xx.xxxxxx Lat yyy.yyyyyy, then they will be able to contact rescue authorities and tell them "he is in a creek bed, about 5km North East of the intersection of the ABCD track and the EFGH track".

If I send them the Lat Lon via a GPS beacon, the message to the rescue authorities would be EXACTLY the same.

"They also have an ESN and record the owner and contact details"
- only if the owner bothers to register their details when they buy the EPIRB

From: Dave Jones
Topic: 3799 Message: 3855

But do VKS 737 have the ability at all of their bases to punch in your coordinates and work out EXACTLY where you are on a map? I'm pretty sure they do but I've never asked Steve.

If they do - do they want to take responsibility for making sure their interpretation is accurate, and if it all falls over who pays for the ESO response?
It appears that they do because they can ask over and over if the HF conditions are lousy until they are sure you said what you did.

BUT if it comes from a beacon it's a different story and the message won't get to the authorities at all because VKS have been advised that the location details are subject to corruption.

Extract from their page:
Another aspect of this HF - GPS interface is that your location coordinates can be transmitted by your HF, to a remote, suitably equipped station. While this may be desirable for members in certain circumstances, the VKS737 network cannot offer to accept and process this data for members. This policy is a result of advice taken from our insurer, on the basis that the spoken word from member to base station operator is effective, because accuracy can be checked until satisfied.
In the case of GPS data transmission, the data may be corrupted by conditions and circumstances prevailing, and the technology in use will not highlight any errors.

In emergency situations, rescue authorities could be unwittingly relying on inaccurate advice.

End quote

Dave

It strikes me that "inaccurate advice" may be better than no advice at all ?
Blasted insurance companies. A friend is trying to attract tourists to his property on Cape York. The place is an absolute wildlife haven and should be an easy success. But he has 200K of private tracks and the insurance company says no way. I've advised him to see if there's any way around it (he cant afford to signpost every turn in the track etc) but so far no luck.
A great pity as its a top radio spot :)))

Cheers
Jim

Air NZ crashed in Antarctica because the co-ordinates were changed but no one bothered to tell the pilots so they flew on the computer course like they had before straight into the side of Mt Erebus.
They didn't do away with pilots either.

Hardly. It's not possible to totally eliminate human error, but you can
try and
make it hard. Difficult to make it completely foolproof, fools are
ingenious.
But that doesn't mean you stop using it.

TE901 was, like many air disasters, not a single major omission or
failure but
a series of relatively minor errors that accumulated to the point where
an
accident occurred.

As you may be aware there was a Royal Commission about it when it was
revealed that the majority of the errors were not down to the crew, but
to
others that made changes that were incorporated in the waypoints
inserted
into the INS systems, but not on the crews briefing documents.

Hi Geoff,
Yes, we just had the anniversary the other day. Seems like it was just yesterday. Don't think there was anyone here who didn't know or know of someone who was on the flight. It touched us all in some way. Not only those who died but those who were lucky to have had something happen which stopped them from being there that day eg. Sir Edmund Hillary.
No one expected anything to happen that day, all the wrong things at the same time. Low cloud, wrong info, old briefings , all added to a tragedy that should not have happened. but like all tragedies better systems and ways of doing things came out of it.

On EPIRBS we have had our share of faulty callouts and double beacons going off. Orion's sent out to find one when there was actually 2 going at the same time. Flat batteries and people stuck in snow caves for days in the Alps waiting for help they thought was on the way. Lost people blaming Search and rescue because they did not come fast enough after their beacon was activated. Beacons being turned off when a search was well under way. Nothing man made is infallible nor is the guy using it. Too many people prepared to blame others because they were not rescued fast enough. I think we all need to remember that this gear is only there to help the lost person, not to be the answer for their often own stupidity. And lastly, too many people looking for someone else to blame and litigate against.
As volunteers we have now changed the way we manage searches, its mostly done by committee and consensus and we now have a great source of statistical data available from around the world to work with. 99% of the time people fall into lost party statistics. That way 1 person cannot be held responsible for an error or line of errors. We make the best decision based on the information we have.

EPIRB's and GPS references, via either data or voice always have to be taken with a grain of salt and errors taken into account. I personally would not be to worried about data transfer errors over the radio as 3 out of 5 voice GPS references are usually given wrong anyway.

That's my thoughts anyway :-))))))

Malcolm Langley.

No.

I was one of many people on that day calling them when they were
overdue. But we knew Something Bad had happened.

> But do VKS 737 have the ability at all of their bases to punch in your coordinates and work out EXACTLY where you are on a map? I'm pretty sure they do but I've never asked Steve.

No.

Not all base operators a computer literate, or have access to the aproiate software.

Most VKS bases are remote operated via a telephone interconnect, the operator could be anywhere in the country, this makes receiving GPS signals via data transmissions a tad more difficult.

And yes the error in GPS position reporting via voice is still great, there are a lot of people out there that own GPS's and think that they are a life line, but they can't read a map or interpret the info that the GPS is telling them, so it is very easy for them omit valuable data when giving there position. I have been on the receiving end of this, luckily I sent the rescue helicopter to a physical location not a GPS position.

The 121.5 Mhz EPIRB position when reported via satellite can be anywhere within a 200Klm radius. This signal when first detected is given a 10minute window before any action is taken, this helps eliminated false detection.

Most SAR aircraft are fitted locating devices that when flying over head can pinpoint the epirb to within a few meters, aircraft not fitted with this equipment can narrow the search area down to within 20Klm, A fairly large radius if you are in bush and unable to give a manual signal.

It is also possible that if two epirbs are activated within 200klms of each other that the stronger signal will be the only unit that will be detected.

The 406MHz system does away with most of the problems encountered with the 121.5MHz.

The new digital EPIRB's (403 mhz) download data from your GPS to send
their exact location.
The old "Analogue" EPIRB's (121.5 / 243.0 mhz) depended on COSPAS
/SARSAT data being downloaded
to the Australian SARSAT (I think) terminal at sea safety Canberra, now
AUSSAR. This gave a relative location
and then aircraft zeroed in on it. At least this was the story when I
worked at the old DOC / SMA and we used to chase
the damned things when they went off in peoples garages etc.

Hi Geoff,
I didn't mean the EPIRB did the doppler measuremen, only that it was
still the system used for finding where the beacon was.

Cheers
Wayne

"The new digital EPIRB's (406 mhz) download data from your GPS to send their exact location."
- only as an option, if the owner bothers to set up the connection.

AusSAR can identify the owner of every 406MHz EPIRB transmission and call them to check it isn't a false alarm
- only if the owner has bothered to register their details after buying it.

Date: 2004-12-07 00:15:12 UTC
From: Chris
Topic: 3868 Message: 3868

Folks,

I have the coolest new toy, and it's probably the best way that I know to justify buying a GPS receiver.

My wife and I have a VR Calais, so it has a speed alert facility.

Our Bond 875 never goes fast enough to break any speed limits (you will understand why if you have ever driven a 3-wheel car!), but the MX5 is another thing altogether.

It's an NA6 (1990 model) with *lots* spent to make it go faster in both a straight line and around corners, and Adelaide's roads are great to punt it around with the lid down.

However, the local folks what make and enforce the road rules have installed more and more red light and speed cameras, and it's only a matter of time until my wallet gets hit!

Problem solved thanks to Dick Smith and Uniden.

The blurb from the DSE site
(http://www.dse.com.au/cgi-bin/dse.storefront/41b4f526076ff26c2743c0a87f9c074f/Product/View/D2749)
says:
* Navigate to a Suburb - the unit has 5000 preprogrammed Australian and New Zealand cities and suburbs and a built in electronic compass which allows the user to select the destination from the menu and a directional arrow on the screen will navigate to the suburb.
* Navigate to Marked location - you can program up to 500 points of interest.
* Fixed Speed Camera Warning
* Red Light Camera Warning
* Black Spot Warning
* As the user approaches these locations, the unit will alert the driver through a three stage visual and audible warning system. The warnings occur approximately 800 metres, 400 metres, and 160 metres.
* Speed Alert Warning
* Trip Computer - uses the LCD display to advise distance to destination, average speed, maximum speed and current speed

You download the latest black spot, speed camera and red light camera data from the Uniden site once a month, and it's accurate!

We use it to warn us when we are going over the speed limit and warn us of cameras, but it would be a ripper in the Bush or the boat, as well.

You can mark 500 waypoints, so getting to the camp site or the fishing site is a doddle, and it only misses out on a pretty graphic display.

It directs you by changing arrow directions on the display, and that's quite good enough for us.

Best of all, it's only $288!

Now, how to get NMEA 0183 data out to feed into my NGT?

HTH - Chris

Yeah I love these things. Paramedics enjoy good road trauma and anything that lets people think that they can speed and get away with it is good for me! I much prefer a really good prang to a minor act of mechanical intercourse; you know the one with one occupant covered by a blanket while we get the SES to cut the others out of the car, and then it gets really exciting when the helicopter lands.

Then the CFA get to use their gear when they hose the road off afterwards. And even the government undertaker gets a guernsey when they get the one under the blanket later.

Yep, can't think of anything better. Much more fun than going to an asthma attack or a chest pain.

I bet it doesn't pick the unmarked TOG car coming the other way with the gutter mount on.....

Speed only makes you hit harder,

Dave

Quote off.

Lots (accentuated) spent to make it go faster .... and Adelaides roads are great to punt it around....

Only a matter of time before you get fined....

If you don't speed you don't get fined, you bought this device that warns of speed and red light camera locations and advocate it's use for that purpose.

You went on to suggest that you use it to warn when you are speeding, this is true but also to warn you where the cameras are.

If you aren't speeding you don't need to know about cameras.

The whole context of the email was fine avoidance for unsafe & illegal activity.

I am sure I'm not the only one who read it that way.

I am pleased to hear of your driving history. My only question is if your driving history is so immaculate, and you are such a proficient driver, then why suddenly because you own a faster car do you need this device? Surely a good driver should be able to judge speed and drive accordingly without it?

Or (tongue in cheek and humour switched on - and yes I do have one and like most ambos it's a bit black at times) did you just need an excuse or two to justify more money and another toy to the missus.....

Sorry you didn't like the criticism but I think these devices encourage death and destruction.

Dave

Dave,

This is going to get very boring.

I just called two ambo mates who have been in my little red car, and neither read the post that way when they checked it out.

They also (have been in my car, remember) know that I don't go over the speed limit.

They also know that I punt hard around corners, and that I have the driver training and vehicle to do so.

I always appreciate constructive criticism, but am not getting it here.

BTW, it also warns you about Black Spots (another reason for buying it), so maybe I should disable that function?

You said "The whole context of the email was fine avoidance for unsafe & illegal activity." - I found that offensive and deliberately personal.

I am having lunch with cops and ambos on Thursday, so will print this thread out and see what they reckon.

I'm out of here before I get cranky - Chris

Hi Dave Jones

Gee pal, you have sure missed the boat. The Government DO NOT want to stop death and destruction. If they did they would not be part of a programme that has caused the death of more Iraqies in the last 12 months than died during the whole CORRUPT Saddam regime. It's not limited to what is happening overseas either. Just read what lengths these moronic terrorists will go to. The question is not if they will strike here it's when.
Don't have a go at someone for having a fast car. There are many places that speed is allowed off the roads, as well as the Northern Territories roads. It appears that you completely ignore the fact that where people once saw policing of speed as a means of improving safety, they now think of it as only revenue raising. After all what else can it be, if you commit an offence and are detected, but then wait anywhere up to 6 to 12 weeks to be notified. What damage can be done in that time? If the Government was serious about stopping road deaths, they would have penalties imposed that make drivers AFFRAID to speed, without creating financial stress on the innocent. Sentences that force the speeder to spend most of their free and holiday time doing worthwhile community projects could be a start.

Jeff

Topic: 3868 Message: 3875

I wonder if the moderator might like to kill some of the messages that seem to be against the spirit of this group? And perhaps make it that some members have to have posts approved?

Surely if people wish to get involved in arguments (apart from interesting technical ones about HF radio, etc) and political statements it would be better to respond to the individual than post to the group?

Howard

From time to time this group wanders off topic. I've been guilty of it myself. This time (this sounds familiar) some members feel that this topic is an off topic. (offenders please slap your own wrists).
Please confine any further posts in this area offline.
Cheers
Jim

I agree this has got off topic.

I also agree that speed cameras are more about revenue raising than road safety and that governments are more interested in revenue than saving lives - particularly in Victoria where lowering tolerances below ADR specs for speedos and running an unreliable camera network caused a loss of faith in the system anyway.

BUT I never said anywhere that the government was interested anyway.

I apologise if I have caused any offence to Chris. Go back to the original response and it was purely about the device in question and road trauma. No name, no pack drill, nothing personal at all.

The second post was probably unnecessary and a bit provocative.

Back to the only remotely HF related thing in the whole thread.

A] Can it be hooked up to his NGT?
B] Where the hell do you put a 9350 on a little red sports care?

Sorry Chris, end of discussion before we get Jim's nickers in a twist....oops I've got mail and it's already happened.

Dave

PS Thanks Jeff for pointing it out - my surname is Jones. My last car was a Gen III Berlina so the fast car was never an issue - fast cars can be driven under the limit too. How Iraq and Saddam related I have no idea.

Dave,

Subject closed - but before I got to use some great one-liners :-(

Look at Erin1 in the photo section of this group to see how to mount a 9350 to a Bond 875.

I used to drive that on the M25 talking with European amateurs on 15m.

Chris

3880. Re: Different radio, new saga - 8551C - Fixed.

Yahoo group: codan_outback_radio (1997 — 2004)

From: Andrew Stephens
Topic: 3880 Message: 3880

Finally, I have a fix.

It turns out that there are 2 different types of aerials. 1 is the Codan and the other is a moonraker antenna. The difference to the 8551C is that the main IC (an EPROM) has different code in it. The moonraker chip has a 90-20127 code and the Codan has the 90-20134. I managed to borrow a 90-20134 chip and plugged it in and, whoo hoo it worked. This thanks to the suggestion from Peter James in Geelong. Now all I need to do is get the chip re-programmed and I am done.

Thanks to all, for putting up all of the suggestions and the support, I think that I know it inside out now ... well maybe not.

Cheers, Andrew.

Congrats Andrew.

I admire your persistence.

It's a pity there wasn't some notation to that effect on the outside of the case - or a different model number.

The silver lining is I guess that all the time you've spent may save the hours of someone else who searches the archives (or asks Jim) in the future!

Dave

Great, you have found the problem. Now I'm not trying to rain on your parade but ...a different set of instructions for the moonraker ? Hmm.... Same circuit but different instructions ? Why ? Did you try replacing with an identical chip or just the different numbered one ?
Now I'm sure that all is well and good and my suspicion stems from my ignorance of the two different Eproms, but can anyone tell me exactly why the different aerials required different eproms ?
Oh give up Jim, it's fixed that's the main thing !

Cheers

Jim,
I changed over to the Codan numbered chip, which worked. I assume that the difference in the programming is the difference in the phasing of the control to the 4 phase stepper motor, since this is mostly what the chip does. I guess that it is all in the timing. Suffice to say that with the original chip (the Moonraker program) it errored in .5 second. As soon as I put in the Codan programmed chip, the antenna started up and tuned in the selected freq. I do also remember reading that the 8551 can be used on different systems, and that there are some jumpers (or in some cases, relays) that are used to setup the 8551 for the different scenarios.

Cheers, a relieved, Andrew.

Hi Dave,
I got one from Jim some time ago now, maybe a year. It stopped tuning reliably, pulled it apart, made the mods as I have detailed in the files and it has never failed once since. Have now sold it and moved on to a 9350. Best thing I ever did. The guy who has the 8558 is rapt as you just cant buy them second-hand over here.
I have a few less useful things which really are fence posts ;-))))

But your right, he must be cheap. Probably doesn't want to incl a pic as they might be in a really sad state :-((((((

I posted here about the one I got.

One of the stainless cap screws holding the housing onto the base had seized into the aluminum and some butcher had sheared the head off it trying to get it out.

I had to remove the head (which I was going to do to service it anyway) but then I had to rotate it about 10-15° and re drill and tap the holes to mate to the base.

It all works now - needed the impedance jumper changed for my vehicle - but it was a world of work that I shouldn't have needed to do.

They were ex SA police from when they upgraded to 9350's.

To be fair the guy selling them when I bought mine gave a fairly accurate description which this ad doesn't but no mention of the sheared bolts(different seller in different state) and included photos. He also very decently offered to exchange the one he sent me for another as he had a few but given that I got it going I figured it wasn't worth the postage.

Which brings me to another point he shipped mine he sent it Aus post for about $15. This guy wants them picked up or couriered and a tank of juice to SA & back is hardly worth it, and a courier won't be cheap either.

Though I still wouldn't mind another housing...

Dave

Have,
sounds like your experience with the 8558 was pretty much the same as mine except all the bolts sheared off when I pulled mine apart. Guess they hadn't been touched since some time between 1985 and 93. Dissimilar metals, oxidation and all that sort of thing. Lucky getting a mew tap and bolts was not really an issue.

The antennas where physically different. The Moonraker was center loaded
and the other Codan one is base loaded.
Different amounts of rotations of the stepper motor end to end of tuning
range.

Incorrect stepping pulses being returned?
Too many years since I owned a Moonraker one. Tested 3 different
varitions of the top whip for Codan, as well as a vibration reduceing
nylon mounting "spring" between base and bullbar to reduce vibrating out
of tune problems etc.

I guess that when we get into the "why is it so " then we are sometimes second guessing the designers. A wee bit difficult if there's no documentation. My book doesn't mention Moonraker or different IC's at all, and this is the first I've heard of the IC thing.
Now I can follow the operation of the unit Ok but as far as I can see only the RF actually "comes back" in the form of swr. Hmm...yep, I'm missing something here. Perhaps as I originally posted and Malcolm mentioned, the original Eprom might of been crook.
Cheers

Hi Jim

Please excuse mi ignorance. What is ADSP? I have a new NGT which replaced an old 8525 which was upgraded to an 8528 spec unit years ago. Knowing people at Codan certainly helped.
Would I be correct in assuming many of the mods such as ADSP is already incorporated in the NGT?

Digital data transmission using OFDM with a bit rate to
encode voice accross a assigened bandwith of 2.5Khz, should get 3-
4kbit allowing for propergation phase and group delays (OFDM should
be able to tolerate lots of phase delay as it uses many low baud sub
carriers)also using a very low overhead FEC and with a gutsy DSP as
voice coder and with data compression be able to run limited internet
desktop applications across a HF radio channel.

would be my wish list for a HF radio.

3915. Re: [codan_outback_radio] Re: So...what's new

Date: 2004-12-09 03:07:51 UTC
From: Jim
Topic: 3912 Message: 3915

Hmm...lets see. The benefits of OFDM are high spectral efficiency, resiliency to RF interference, and lower multi-path distortion. This is useful because in a typical terrestrial broadcasting scenario there are multipath-channels (i.e. the transmitted signal arrives at the receiver using various paths of different length). Since multiple versions of the signal interfere with each other (inter symbol interference (ISI)) it becomes very hard to extract the original information.
So what does all this mean once we break the jargon barrier ? Such techniques would seem to have limited potential useage for the average HF user who may like to surf the net while in the Gibson desert although I can't see why. Do they lead to increased raliability of HF communications ? It sounds like they might.
Would OFDM be a possible solution to interferece from BPL ?
If thats the case, what degree of improvement can we expect to see and how far away is it ?
Cheers
Jim

Hi Troopy,
Thing to do would be to try it with an 8558 before doing anything with it. That would give you a more definitive answer. After all, it wouldnt be the first time 2 of the same thing were faulty. :-))))

Jim,
I thought about those 2 boards and wondered if, seeing as they came from the same place and were used in trucks that maybe they can have a problem if connected to 24 volts by mistake before the protection switches in??? That might explain why the lamps in the 28 head had blown as well???

Subject: Re: [codan_outback_radio] Re: Different radio, new saga - 8551C - Fixed.[Chat]

Jim,
I thought about those 2 boards and wondered if, seeing as they came from the same place and were used in trucks that maybe they can have a problem if connected to 24 volts by mistake before the protection switches in??? That might explain why the lamps in the 28 head had blown as well???
Regards,

Malcolm Langley.

2 crook eproms isn't far fetched. I have seen two crook 8528 selcall boards in the same week. Turns out that one of the IC's used in them is particularly susceptable to voltage spikes etc.
Cheers
Jim

Can you imagine it.

"Radio, send my current GPS position"
You dont have a GPS !
"Radio change frequency to channel 123
Thats not the optimum frequency at the moment
"Radio tune aerial on this channel"
I would if you hadn't hit that branch , you dummy
"Radio turn volume down"
No! I'm listening to my mate.
"Radio turn off !!"
"Listen bud, you drive the car and I'll worry about me, OK"
"Thats it Radio !!!! I'm unplugging you"
Hope you dont expect the engine to work, or the fridge, or theeeeeeeee....."

Cheers
Jim

Yes, I thought of voice command as well. That would be pretty cool :-))))) What would worry me is what would happen when a certain 4 letter word that starts with F were used and the radio was listening?????

Malcolm / Jim,
A couple of things. The 2 units came from different places. One came from some mines and the other came from a local auction. 2 worlds apart, although, I guess it is possible that, in the end they could have come from the same place. The only real way that I could test this, would be to get both of the ROMS erased and then re-programmed, to be sure. However, that being said, 2 people, 1 from Adelaide and the other from Victoria, both having electronics shops, and in the Codan repair trade, said that there was different software in the EPROMS for the 2 different antennas. Peter, from Vic, had one on the bench as I talked to him and said that it was connected to a Moonraker tuner, and that it had the 90-20127 software in it, and that this was the WRONG software for the Codan antenna that I had. Peter, is the guy from Lara Electronics, the mob that are setting up the GPS logging system over HF.

Cheers, Andrew.

Hi Andrew,
No need to get your knickers in a twist. Does that mean that someone else who repairs and sells Codans cant offer a suggestion as well???? I was only offering help.
I still think it would be interesting to try them both on a 8558 before doing anything else though.

wrote:
> Hmm...lets see. The benefits of OFDM are high spectral efficiency,
resiliency to RF interference, and lower multi-path distortion. This
is useful because in a typical terrestrial broadcasting scenario
there are multipath-channels (i.e. the transmitted signal arrives at
the receiver using various paths of different length). Since multiple
versions of the signal interfere with each other (inter symbol
interference (ISI)) it becomes very hard to extract the original
information.
> So what does all this mean once we break the jargon barrier ? Such
techniques would seem to have limited potential useage for the
average HF user who may like to surf the net while in the Gibson
desert although I can't see why. Do they lead to increased
raliability of HF communications ? It sounds like they might.
> Would OFDM be a possible solution to interferece from BPL ?
> If thats the case, what degree of improvement can we expect to see
and how far away is it ?
> Cheers

Jim,

Good discripiton of the benifets of OFDM, well when i ment limited
internet access applications i mean maybe sms text, chat test and
text only email, i doubt web surfing would be a option really, its
would occupy a channel for too long of a time, not to mention we
would die of bordom waiting.

Andrew the main thing is yours is fixed. But the issue of how a different eprom can account for almost instantanious the fail beep needs to be addressed in my mind, and perhaps for the archives.
The reason I'm making an issue of it is not to say that you or your advisors, and I believe at least one is on this list, are in any way incorrect. But the mechanism by which it does could probably be explained by others. I'm simply trying to draw it out of them.
Cheers

Hi Troopy, Malcom and Jim

I have enjoyed the "intense" discussion re 8558's, Moonrakers and 8551C's.
I run 2 Codan 8558's as a tunable dipole1.8MHz to 17MHz. and a Moonraker
AT230
as a HF all band Monopole (2-30MHz).

For information, the dipole 8551C's have eprom's numbered 90-20134 issue 1
in them and
the Moonraker controller an eprom numbered 90-20127 (same as in your email).

There are obvious reasons for software differences if the loading coil
differences, thread pitches
and internally timed counter resets are considered. In addition the AT230
has a part loading coil
short, set by the controller, to allow the unit to get up to 30MHz.

Having thrown in my information, I have now decided, at this point, to
retire to the background
and enjoy the remainderof the discussion.

Keep it up.

Cedric

Malcolm,
No twisted knickers here. My frilly pinks are still
ironed and comfortable, (mmmmm frilly pink knickers) and I
had hoped that I would not offend, sorry if I did. I was
only passing on the info that was passed on to me. When I
talk to Peter again tomorrow, I will ask about it and see
what he has to say, then I can report back to the list with
a bit more information.
I also don't have anything else to test the chips on, but
perhaps once I get the new chip in, if you want I can send
the old chip on to you or Jim for further analysis.

Cheers, Andrew ...

> Hi Andrew,

Cedric, thanks for your post. Very encouraging to ralize that I'm not just being a PITA to all on the list. I really would like to discover how the difference in software can produce such a result. After all, the 8551 can only determine which aerial it is attached to by measuring the SWR ? Inputs, RF and frequency. Outputs, RF and motor voltages for the various phases of the aerial motor. What tells the controller "Hey I have a Moonraker on the end, not a Codan" ?
Yes Malcolm and I have had an interest in the topic. I think both all attempted to do a remote fix.

Geez Troopy , spose yer frilly pink thingies come with pigtails too? I shouldn't say too much, not politically correct to have a go at people with different ...errr...passions. My neck of the woods is full of em "Sorry madam...err...I mean mate " :)) Just look at the strife a certain Sydney personality is in at the moment. One things for sure, I'm not visiting Melbourne in the near future.

Cheers
Jim

From: Jim
Topic: 3941 Message: 3941

510 AUTO TUNE ANTENNA IS NON-SHOCK MOUNT STYLE, AND ANTENNA BASE HAS BEEN INSPECTED CLOSLEY FOR CRACKS, OF WHICH NONE WERE FOUND. NEW CASINGS ARE AVAILABLE FROM BARRETT.

From
http://cgi.ebay.com.au/ws/eBayISAPI.dll?ViewItem&category=296&item=5736974062&rd=1

They don't have shock mounts like the Codans ? Shock, horror (corrugations :) Interesting, as I was told that the Barrett aerials could be used with Codans..with a minor mod. I don't think that this one would be much chop for the outback traveller ??

Cheers

Jim

3942. Re: [codan_outback_radio] Re: So...what's new

Now I'm definately not upgrading. The below post is exactly why I don't take the SWMBO....just don't tell her I said so.

Interesting that you started this thread today Jim as I have just been to the Whale Museum in Eden and they had some old HF sets there. I took some pics and I'll post them after dinner tonight. Had me thinking about where we have come from thus far!

Can you imagine it.

"Radio, send my current GPS position"
You dont have a GPS !
"Radio change frequency to channel 123
Thats not the optimum frequency at the moment
"Radio tune aerial on this channel"
I would if you hadn't hit that branch , you dummy
"Radio turn volume down"
No! I'm listening to my mate.
"Radio turn off !!"
"Listen bud, you drive the car and I'll worry about me, OK"
"Thats it Radio !!!! I'm unplugging you"
Hope you dont expect the engine to work, or the fridge, or theeeeeeeee....."

Cheers

Different drive methods for two completely different stepper motors would be my first guess without looking at it. If you have the 8551 telling the stepper in the Codan antenna to move with Moonraker pulses and timing it'll fail straight away if the timing or pulse output is different and I'll bet they are.

In laymans language it'd be a bit like changing the plug lead order on a Falcon straight six to that of a Commodore V6. It's gonna run like a bucket of s(*& - but then it's a Ford and you might not notice the difference so maybe this is a bad example.

First place I'd start to look and I reckon it's not far off.

Andrew the main thing is yours is fixed. But the issue of how a different eprom can account for almost instantanious the fail beep needs to be addressed in my mind, and perhaps for the archives.
The reason I'm making an issue of it is not to say that you or your advisors, and I believe at least one is on this list, are in any way incorrect. But the mechanism by which it does could probably be explained by others. I'm simply trying to draw it out of them.

Malcolm / Jim,
A couple of things. The 2 units came from different
places. One came from some mines and the other came from a
local auction. 2 worlds apart, although, I guess it is
possible that, in the end they could have come from the same
place. The only real way that I could test this, would be to
get both of the ROMS erased and then re-programmed, to be
sure. However, that being said, 2 people, 1 from Adelaide
and the other from Victoria, both having electronics shops,
and in the Codan repair trade, said that there was different
software in the EPROMS for the 2 different antennas. Peter,
from Vic, had one on the bench as I talked to him and said
that it was connected to a Moonraker tuner, and that it had

the 90-20127 software in it, and that this was the WRONG software for the Codan antenna that I had. Peter, is the guy from Lara Electronics, the mob that are setting up the GPS logging system over HF.

Cheers, Andrew.

I haven't had a good look at it but it would have been a simple test to see if the VSWR was static or changing. If the tuning coil isn't moving because the motor isn't turning then there should be no change of VSWR.

If after half a second there's been no change then there must be a fault. If the coil was moving there would have been a change in VSWR.

I'm not saying that's how it's done, it's a supposition as I haven't had a good look at the service manual or drawings for a while but it's a logical assumption.

Hi Jim,
It is an EEAARRLLYY (read very early) unit. The later units have shock mounts made from 8 rubber mounts, four bolts & 3 metal plates, Look at the 910 on the Barrett site as it is the same as most of the 510's.
Also the later 510 & 910 bases will fit the early 510's.

http://www.barrettcommunications.com.au/pages/ant-mobile.html

I would fit the later base if I was going to use it.

Cheers
Wayne

Interesting thread and lots of posts too,

They cant be that different but I can only speak for the early moonraker used as a Codan 8555 not the current model AT230 or similar. I spent a fair bit of time going over both manuals for the 8558 and 8555\8551 before I fitted it to my vehicle. The wiring and controls lines are 100% compatible on both the 8555 and the 8558 antennas and they both have the inbuilt preamp for scan\RX only. I successfully used the Moonraker with the Option AD board for over 12 months before fitting my 8558 at the beginning of the year. From my experience I would speculate that there would be different parameter settings in the eprom in the 8551 for the different antenna models but I would say it would be timing and number of rotations of the inductor. Occasionally with the 8555 I would get the odd tune fail message but I have the same case with my 8558.

Regards

Paul

vejones@...> wrote:
Different drive methods for two completely different stepper motors would be my first guess without looking at it. If you have the 8551 telling the stepper in the Codan antenna to move with Moonraker pulses and timing it'll fail straight away if the timing or pulse output is different and I'll bet they are.

In laymans language it'd be a bit like changing the plug lead order on a Falcon straight six to that of a Commodore V6. It's gonna run like a bucket of s(*& - but then it's a Ford and you might not notice the difference so maybe this is a bad example.

First place I'd start to look and I reckon it's not far off.

Dave

Andrew the main thing is yours is fixed. But the issue of how a different eprom can account for almost instantanious the fail beep needs to be addressed in my mind, and perhaps for the archives.
The reason I'm making an issue of it is not to say that you or your advisors, and I believe at least one is on this list, are in any way incorrect. But the mechanism by which it does could probably be explained by others. I'm simply trying to draw it out of them.
Cheers
Jim

Malcolm / Jim,
A couple of things. The 2 units came from different
places. One came from some mines and the other came from a
local auction. 2 worlds apart, although, I guess it is
possible that, in the end they could have come from the same
place. The only real way that I could test this, would be to
get both of the ROMS erased and then re-programmed, to be
sure. However, that being said, 2 people, 1 from Adelaide
and the other from Victoria, both having electronics shops,
and in the Codan repair trade, said that there was different
software in the EPROMS for the 2 different antennas. Peter,
from Vic, had one on the bench as I talked to him and said
that it was connected to a Moonraker tuner, and that it had
the 90-20127 software in it, and that this was the WRONG
software for the Codan antenna that I had. Peter, is the guy
from Lara Electronics, the mob that are setting up the GPS
logging system over HF.

Cheers, Andrew.

Paul, thanks for your post. Interesting to hear from people who are/have used the 8555/8551 combo.
Now the question of timing etc has to be addressed. As I understand it, the function of the 8551 is basically to supply the voltages to drive the stepper motor (if we forget preamps and Z switching). So we need to turn the motor this way and that for various frequency ranges in order to find minimum SWR. The unit knows the frequency by measuring and dividing it and then off to the eprom which looks at it and says yeah , output to lines 1,2,3 or 4 for 2 secs. Now obviously different aerials will need different parameters to be written into the eprom, fair enough.
But the unit doesn't "know" which unit its attached to unless the motor zooms around and it says "oh oh". This would give us the fail indication. But in this case the fail indication was almost instantanious.
Since the unit only sees the RF swr until the motor rotates, and in this case it didn't rotate, I'm still left wondering how the 8551 "knew" it wasnt connected to an 8555.

Cheers
Jim

Topic: 3949 Message: 3950

Hi Jim,

I cant see how the 8551 could determine antenna type, and the only info I can remember quickly about instant tune failure is if it detects no RF power - takes about two seconds then times out. There is a section in the manual that talks about tune failures and reasons. By the way - I just remembered something else about the 8555, the statement I made about 100% compatible - well about 99% compatible - the moonraker did not have the two 22 / 35 ohm switching to look for a better match that the 8558 has - and from memory I think the 9350 has four switching positions - anybody care to expand??

Now unless I am off the mark the early antennas are not as smart as we seem to think, roughly speaking just a stepper motor driving up/down for lowest reflected power which translates to logic states representing VSWR >3:1, >2.5:1,>2:1, >1.5. along with reference to the logic board for info. about motor control and which way to start tuning with relation to frequency from channel data to decrease tuning time.

The only place where there would be some smarts would be between the logic board and the antenna controller. There is no addressing,data or ID past the controller to the antenna and no obvious control lines that could differentiate antenna type or status.

I had a friend who built a similar autotune with electric motor and roller inductor but the sensing circuit looked at phase relation (ie. reactance) instead of VSWR for tuning. I don't know if this is more accurate but it did the trick.

my 10 cents

Paul

He made a miniture version to use with his Yaesu FT 817, it was about the size of an 'C' cell eveready torch with a 5/16 base on the end for a whip section. A portable shunt fed auto tune whip only weighing a few hundred grams with the tuning circuit using surface mount components mounted in the base. very smart person with more time than you or I :))

Hi Jim/Paul

We appear to be getting closer to solving Jim's question.
I vaguely remember the thrust of Paul's comment re, no impedance matching circuit in the 8555.
At initialisation the Micro tests pin 12 which is fed by a level detector sensing a Hi in the 8558
Z matching circuitry. No load Pin 12 stay Lo. Processor spits the dummy.
The above circuit is replicated on pin 11.

If both pins 11 and 12 are Hi, then the unit allows changes of the control between alternate antennae (8558's).

I return to the background.

Cedric

Thats right, (jogging my memory here)

The 8551 was designed for the 8555 and 8556 as the one antenna did not cover the frequency ranges of the transceiver - the 8555 was 2-12Mhz and 8556 was 12-24Mhz. I was able to get my antenna to tune past 12Mhz (up to 20M and 14Mhz 4WD frequency) with a shorter whip approx 4ft.

Hi Cedric,

I think it was you who so kindly sent me the manual for the 8555 a few years ago. I have passed the manual on to Ben (moderator) earlier this year to look at putting on his website.

Kind regards

Paul

That's basically what I said about the differences of the 8558 and the moonraker antennae. Also the early model Moonraker antenna needed a mod to get over the 24 mhz limit. Could be the "part loading coul short" mentioned by Cedric. I also tested 2 firmware updates for the moonraker from Codan, 1 was eprom only and the other eprom and hardware mod. That wasn't difficult, didn't even have to pull the 8551 out of the Patrol. The antenna worked well and I only stopped using it when it turned into a banana after a front quarter prang with a car that came through a stop sign. Cut that car in half (Mitsubishi colt.) bent the drivers side guard and bullbar on that side and the antenna bent forward from the top of the motor housing due to exceeding the movement in the rubber vibration dampers. Top whip and bits found 100metres down the road as the "Pivot pin" holding the whip assembly to the top of the antenna snapped. This version of Moonraker originally only had a whip top that pivotted forward and back and it took 2 mods to get to a spring interface for all round movement. Whip top was a solid aluminium tube about the diameter of the fibrglass whip on the 9350.

Gidday Jim(hz180).With your vast experience could you tell me which auto-tune antenna is the best.A 9350 or 8558.The reason I am asking I just purchased a 8528 remote radio and the 9350 antenna and was thinking of changing the auto tone (8558)on my 4by to the 9350.
Any suggestions would be appreciated.
Thanks Martin(locallaw)

Hi Martin, without doubt the 9350 is a much better unit. The 8558 is getting so old that spares can be a problem, and parts of them can be very brittle. One thats working well is a real gem but for how long?
The 9350 is not only much more reliable but tunes MUCH faster.
Swapping the 9350 for an 8558 would be like going from a Landcruiser to a pushbike in my opinion :)))
Cheers
Jim

Without any shadow of a doubt the answer is the 9350.

Of course if by some chance you have read this far and forgotten the first sentence already you could sell me your 9350 and keep using the 8558.... :)))

What radio is your 8558 hooked up to?

Dave

Oh come on Jim a pushbike - isn't that a tapped whip type comparison.

An 8558 is surely closer to a Mark II Landrover...

Many faults but okay while it's working - just a little slow.

Dave

Martin,

I am guessing you know that you need to remove the AD board from the 8528. I think you must because I'm pretty sure the connectors are different anyway.

Gidday Dave,
I know nothing about these radios.Switch on select freq press ptt button.Are you saying that the AD board is not required when useing a 9350 antenna.I used the cable that came with the 9350 as the multi pin connector was different on the 8558 antenna.Can you run me thru about this AD board ie removal etc.I take it that something like the AD board(that is in the radio)is installed in the 9350.
Thanks Martin.
PS no one in Mackay wants to handle Codan radios.

Ahh, good point. I just assumed that you knew that you had to take out the AD board. Unscrew the bottom of the radio, the longer cover. With radio front facing you look at the left back (not the PA :) and you'll see a smaller board connecting with ribbon cable to the aerial control socket. Carefully remove the board and then plug the cable back into the pins that connect the board underneath.
With the board removed your 9350 should tune OK. Just remember to put it back if you ever need to connect to your 8558.
Cheers
Jim

Hmmmm, yes and not to mention the ridiculously high BAC readings - there was one fool who blew .315 recently! That he was still on road and not wrapped around a tree or a pole is another of those miracles that we hear about this time of year.

Now that the silly season is upon us (I know becuse the traffic here is dreadful again), I'd like to thank all of those on this list for their contributions over the past year.
May you have a happy and safe Xmas wherever you are and whatever you do.
Cheers
Jim

3990. Codan NGT with Amateur Radio Mod

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-12-16 00:19:34 UTC
From: born2roam63
Topic: 3990 Message: 3990

Hi All,
Have recently purchased a Codan NGT with the Amateur Radio mod fitted and have so far been very happy with it.Gave it a fair work out recently on the VKS and amateur freqs as we have just moved from Victoria to Darwin. It was a bit of a culture shock to have all of the bits and pieces in the hand piece as while I am chating (well as my wife says able to talk under water with a mouthfull of marbles) I finish my over and go to glance and the front of the radio and it not there, thats right, i'm hang on to the front of the radio.

Any way I was wondering if any one else has used the NGT with this option and if you have found any bugs that I have not come across yet. I am aware of one and that is that the GPS send will not work with a radio fitted with the amateur software. I believe that a patch had been released to correct this (I don't use this option yet so it doesn't affect me) however did not have time to get back to the local dealer before the move.

Anyway thats about all from up here I really appreciate the information that this group generates and have found some very valuable information since joining several months ago. Have a good christmas and happy new year from sunny Darwin (not much rain yet).

regards,

phil

p.s. does anyone know of a reputable dealer in Darwin for the codans.

Hi Phil,

I have been waiting for the A Option to be released by Codan for over 12 months here in Brisbane. Last week, Todd from Codan said it would be officially released in a week or two so you must have about the first in oz. Who did you get it from? I hope to have it fitted the next time I am in Brisbane,

From: Chris
Topic: 3990 Message: 3994

Phil,

I was Crash Test Dummy #1 for this feature, and love it.
However, I don't have a GPS receiver attached, so didn't see that side of it.

I sometimes pop up on 30m and 40m, and you can bet that I will be using the NGT :-)

For the information of our Italian cousin, Option TXE is illegal in Australia, so we do not have the ability to program frequencies as you do.
The Australian regulations also prohibit manufacturers making programming software available to the general public (imagine what chaos would ensue if Joe Blow could program Tx frequencies wherever he wants!), and I agree completely.
Option A enables VFO transceive in 10Hz steps in the Amateur bands.

Option A has been in beta test for a while now, so users have had to agree that it is unsupported and that any bugs are their problem.
FYI, I have one channel at the centre of each Amateur band, and have a macro that then takes me to Option A with that frequency at the centre, and VFO from there.
That suggestion and macro were courtesy of Peter James of Lara Electronics.

Cheers,

Chris

3995. Option TXE

From: Howard Small
Topic: 3990 Message: 3995

Hmmm. I wonder why users in other countries are able to act responsibly but users in Australia aren't? And if it is illegal, how is it that transceivers open across the whole HF band can be purchased (albeit second hand or ex military)?

Howard

From: Chris
Topic: 3990 Message: 3996

G'day Howard,

Now, that's a long and very involved story, and it changes
dramatically from country to country.

For example, until very recently it was illegal (and rigorously
enforced) to import transceivers into Sri Lanka that were not crystal
controlled.
The rules have been relaxed so that synthesised radios can be
imported, but they must only be capable of being reprogrammed *at the
factory*, not by customers or Codan dealers.

Then try Zimbabwe, where you will only get allocated one frequency,
and that's shared with the whole world and his dog :-(

Codan transceiver therefore have TXE, TXP and TXD, depending on the
regulations in the country of use.

Yes, you can import whatever you want in the way of radios, but just
don't get caught using them here on frequencies for which they are not
type-approved.

It's restricting, but that's the law.

I'm a pistol shooter, and you have no idea how restrictive Australian
regulations can be until you want to buy, sell or import a firearm
that is legal to use here, and for which you hold the appropriate licence.

It makes the rules on transceivers absolutely pale into insignificance
by comparison.....

Cheers,

Chris

Topic: 3990 Message: 3997

Howard as I recall there have been many discussions on this topic in sevral forums.
I suspect that the reasoning behind the rules has a lot to do with trying to keep frequencies free of unwanted intrusions
In the past Australia was (and in some cases still is) fairly reliant upon HF , and the rules were written with that in mind. Apart from the military and the Amateur Service, radios were required to licensed by the Australian authorities. Part of this was their inability to allow front panel programming by the user.
So if you wanted to sell commercial HF gear like Codan you had to restrict their abilities.
Strictly speaking, I believe that radios with such spectrum agility were (are) illegal to operate here.
Yes there have been ex military and amateur gear operated in a manner that weren't strictly legal (and that situation remains). Thankfully instances of problem useage appears to be fairly rare within Australia.
One has only to listen around to hear that the same is not true for many countries.

Cheers
Jim

I wouldn't get excited about trying to get Option TXE for the 9323.
Without TXE but, the Jumper in place you can program in any Amateur Band
frequency.

If you have TXE then you don't have to reset the Transceiver to use a
frequency you have just programmed in.

With TXE, it still takes a while to program all the details for a new
frequency, so it is still too slow for Amateur Band use- you can't tune
around in Freetune mode, hear a signal, Program in that frequency and
then Transmit on it fast enough before the caller has moved on.

Jim,

I believe that it is illegal to transmit on any radio that is not type-approved by ACA, with the Amateur bands being the sole exception.

I could be wrong, but I think it had something to do with the high price of bits after WWII, and the ready avalability of used military gear.

It was not that easy to get the licence in those days (how I hated the essay questions, and envied my friends who did the first of the multiple-choice exams so long ago), and we were supposed to be a responsible mob.

Now, back to Option A.....

It was available in the 8528, but sales were so slow that it was not considered for the 9XXX series.

It didn't take long for people to suss out how to get TXE in them, and there were some development modes available that were fun!

Option A was always on the cards for the NGT (quite a few of us at Codan pushed really hard for it), and using an NGT with Option A just shows how much Japanese radios can drift :-)

It's actually quite strange to get back to non-commercial HF after 11 years talking to mostly only Codans, and having to use a clarifier, after not needing one for so long.

Cheers,

Chris

Ahhh, the good old days. Commercial amateur rigs cost a bomb. I remember seeing a Yeasu tx and Yaesu rx in different cases and they were cutting edge in the amateur world. I bought one of the first FT200's. But nothing replaced the thrill of the first QSO on gear that you had built yourself. Of course xtal controlled tx's also transmitted on harmonics and it was possible to be receiving (AMR300 heavily modified) on one band and txing on another. Took me 3 days of calling CQ (on a mode called Morse Code) to find that out :)) Then there was my homebrew 813 "linear" that knocked out all the TV s in the street. How many remember the "How to get your Amateur License" series in Radio and Hobbies mag ? Or the lower age limits on the license? Or know what a BC221 was ?
The essay questions were actually easier I think, as they gave the marker some latitude. "This bloke seems to know what he's on about, even though the question is on oscillators and he's on about microwave receivers" :)) Oh yes, the tricks one could get up to in order to pass the amateur, broadcast and commercial tickets. Even the practical was often not as scary as you expected, the examiners actually wanted you to pass. You were a person and not a number to them. Bit different to my undergrad days .
How times have changed. So many things look easier, but I wonder if we were the same age again whether they would actually be easier ?
Cheers

I still have a FT200 - at least it drifts in a predictable manner unlike my EICO 7 drifty 3...(1960's valve home brew kit radio)

It would be nice to see the commercial grade equipment at competitive prices to the import lines that could flood the market and set some standards - particularly on the HF data platform.

On the subject of HF data - anyidea on whats available for the commercial HF bands for email service providers and what seems to be the protocol of choice.

Regards

Paul

An interesting lot of replies. I totally agree with the need to ensure the spectrum is used for the benefit of all which really means having rules in place and policing them. I guess my point is that it is not illegal to have a transceiver capable of operating on any frequency in the HF band. I have many recent manufacture high quality ex military sets that I use on the amateur bands that have that capability. The illegality comes in what you do with them.

I suspect it is more of a wink and a nod arrangement between the radio manufacturers and ACA that stops people like Codan selling TXE option sets here - and that is probably a good thing giving the propensity for fools to be foolish if they can but their inability generally to develop the opportunity if it is not handed to them on a plate.

On the other hand it was a heap of illegal activity that eventually forced the authorities of the day to make CB available in this country and later realisation of reality that caused them to drop the individual license for what is essentially a consumer electronic item. But I hope we never see that scene transferred to the HF Bands :(

Anyway as Jim (I think) said in one of the replies, this subject probably has been worked to death in the past. My post just indicates I have too much time on my hands...

Regards to all,

Howard, VK3DLH

Good Question Jim,

I recon the old days were much better for a techo circa 1978 in my
case.
We had no KPI, SLA, Stats and all the management stuff.
You could fix anything with your toolbox and what manuals you can
carry in a milk crate in the back of the van.
Customers had time for a chat and anything could wait.
We had lots of formal training and had test models for training and
proving faults bugs ect.
Had managers that were from a engineering background not a bean
counter or call center manager.

I recon bring it back.

Regards

I remember the BC221 Jim. Used to have 2 of them plus a 1.3 KW 6 channel crystel locked AM ex RFDS transmitter (Cloncurry) on 160 metres. It used to make the street lights dim and brighten when modulating :-). So big you actually opened the back of the cabinet and climbed in, after inserting a safeing plug to A: Prevent the door from closing and locking you in. And B: to prevent the finals from operateing, you could still work on the audio satges but no RF. Audio tubes used to glow blue when driving and the final tubes seemed to think they where lightbulbs.

I also remember mucking about with 510 sets, still in use with Cadets when I was in cadets, and 62's (Loved that dynomotor whine!) AN/PRC 8, 9, 9A and 26 sets.

Sam

Sam, I can remember the parties we used to have at the RFDS facilities with the SOTA girls and the rest of the "floating" population. . The RFDS manager was the biggest party animal and a heck of a nice guy. I was so young and naieve that I thought it was all innocent fun :))
I think the TX's your referring to were the "Jolly Green Giants". They ran about the same power as my B/C tx which wasn't fun to work on in a storm. And I still have a scar on my finget from a HV interlock that didn't work. Was back there last year as a tourist. They are waiting for the old stick to fall down as the riggers refuse to climb it.
Cheers

Frank I can agree with your sentiments. But I was never too keen on those big hot transistors that could give one a nasty bitee.
The problem with those days was the lack of money, something the industry still suffers from. Fancy titles resulting in "promotions" without decent remuneration just wouldn't cut it these days. Prestige and job satisfaction seem to have disappeared from the coorporate dictionary. I never was, and never will be, in favour of the "in your face" Chicago school of management style.
In reflection, life was not only slower but I suspect that for many of us a more innocent time. Should anyone doubt this, try watching "A Country Practice" on TV and then switch to "Fox News". Your insides speed up, your bloodpressure rises and your mouth dries out at the pace.
Just like the equipment I own, I'm getting old :))))))

Cheers

No it doesn't. It is illegal to *possess* a transmitting device capable of transmission on frequencies for which you do not hold an appropriate licence. By capable I mean either tunable or programmed to such frequencies - so mere possession of an FM900 on 2 metres doesn't create an issue.

As I service and reprogram two-way radio equipment, I was obliged to obtain an "experimental" licence to cover myself against the risk of prosecution for such possession.

How likely ACA are to pursue such a course - particularly as they are critically under-staffed - is a moot point. But I can quote one instance where a WA Govt agency was prosecuted for such possession at a regional centre. If you really want I could provide full details.

> I suspect it is more of a wink and a nod arrangement between the
radio

There were VHF highband transceivers by TAD (the M8, some rebadged as AWA M8)which were front panel (re-)programmable. The difficulties that AWA (as the importer) faced in getting them type approved would make a great novel. Eventually approved on the condition that the programming technique information and instructions were never to pass below dealers. I could email a scan of the front page to any sceptics.

> On the other hand it was a heap of illegal activity that eventually

As I recall, my first transmitter (made in the shed, of course) was a 6AU6 followed by a 6L6, then a 12BY7 driving an SA2001 or 6146 or 6SJ6 (there were a couple of equivalents, but memory fades after a few reds....), and the hardest part was the PSU, and winding the chokes.

The second version had a pair of 811As following it, but the internal C was so high that it took off over 14MHz.

A pair of 813s followed them a couple of years later (I bought Elcoma's last stocks at $1 per bottle, incuding base), and 1.8kV gave 400W +/- measurement inaccuracies on 160m - first QSO was W1AW/portable.

Then I fell in love with with 3/500Z bottles, and know someone who has (but does not use) *new* 3/15,000 bottles bought for a song.

CCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCC

On that note (or those notes), I am off to bed.

BCNU - Chris

Dave, we have, but most of it wasn't worth knowing :))

Times were tough back then. Maybe not gravel but bread and jam was a treat. I couldn't go through what my parents had to. And they weren't alone. I still cringe at the memory of the time I was sent to the shop to put stuff on "our account". It got paid when my dad did, every fortnight. If we were lucky. I've never had anything on lay-by, too many memories. My grown up kids think that hardship is when you can't hit the oldies for a "loan". Or when they can't afford the latest techno gizzmo. Their cries of "Oh I'm so POVO" this week" can be heard over the phone.
It's really wierd. I've never been able to publically announce to anyone other than family that "we can't afford it". Because of my childhood it's like proclaiming that I've got leprosy or something.

Some of the things I've almost forgotten.

Everything I learned at the Marconi School except Morse

Microwave hardware

Formulae for anything except the basics of Ohms Law.

Walking everywhere.

Sleeping under newspaper on a railway station in the middle of winter.

Surviving for 3 days on a container of ice cream

Being so poor that I had no concept of tomorrow, I had to survive today first.

Going out with a girl until her dad discovered that I was a "bloody Pom". (Dammed cats and bloody Poms)

Being single.

Feeling much richer when I discovered how poorly off and discriminated against our indiginous people were (times change...)

Being sure that a cure for cancers would exist by the time I was 21

What a "Grid Leak Resistor" is/was.

Radio serials

The Handbook for Radio Operators in the Marine Mobile Service

Anything I learned less than a year ago.

The details of any radio that doesn't start with a "C" :))))))))

Now, what dill started this thread....WHAT? Mois again ?

Cheers
Jim

Hi Sam,
I to played with 510's & 26 sets but know the army regs that looked after the gear so we got sets that were dead (scraped) & fixed them. My unit had a good set of radios when I had done.

I also have two 510's in my shed now (from a auction 20 years ago) & a guy that is interested in buying them. They still work I think but it has been 20 years since I have had a set of batteries for them but they did work when I got them. Now using the counterpoise from one with my backup hf set a lunch box Mk2.

The 510's & 26's used bottles to, very small with 1 volt heater units.

Cheers
Wayne

Well guys I can't remember all of those bottle rigs (but they did hold a big interest for me) but I can remember that, those were the days that there was enough room in a car to run your FT-101 as a mobile rig or four wheel drives had enough over head space to make the inside look like the flight deck of a 747after bolting the first of the all transistorised amateur rigs to the roof.
I was lucky enough to do the multiple choice exams but I must say as a first year apprentice mechanic even the novice exam with the 5 wpm morse had me doing a lot of study. But it got me on air and some technician apprentice mates who wouldn't lower themselves to just a novice licence (actually they were just waiting to cover all the exam topics in their apprenticeship first) used to call me the black sheep of the local radio club due to my trade and the fact that the next closest member was more than twice my age.
I have built a few things, nothing with valves though and have enjoyed it all thoroughly, I have built some of the weirdest looking antennas from bits and pieces when I was a young fella on the farm some worked and some made great clothes lines, my first short wave receiver was a 2 in 1 record player/radio (valve) and yes it did play 78's.
I think that its good to reminisce as we often spend to much time looking forward and not where we came from, the best thing that I like about voice communications is that I can still use the rigs that I got as an apprentice to talk to people that purchase a radio today even if I can't understand all the jargon. I do take my hat of to those that can build a radio from scratch and often wondered how many burns people used to get from the valves. RF burns are my main forte now days well accept for the occasional welding and BBQ burn I guess.

Phil

We didn't have a shed but we took over the garage.
Well the ex RFDS transmitter shared the garage out the back with a 500
watt VHF AM ex DOTA transmitter modded to SSB by my younger
brother and the good ol' RFDS transmitter ended up being modded to act
as a large Final Amplifier with drive coming from a novice version (10w)
,bu**er if I can remember the brand, oh yeah, Kenwood TS 130s
tranceiver. Band changes as well as large in band changes where an effort!
The 2 high pressure tankstands (80') at the homestead made nice
supports for a G4, that's it my memory's shot, you know one of those
"Double baz**ka" things.
That's it, too long ago :-) . SOTA has closed its HF and now does
phone connect, Cloncurry RFDS is now a museam and RFDS at Mt Isa
is doing interesting things, like it's frequencies are also in Longreach
bases channels as well. Etc. Etc.

Wow Sam, you were rich :)) All that gear. *sigh* . I actually have the 100w TS130 here in storage for my brother who's o/s in the UK. Nice little rig thats dated but still going strong. And I know a collector that has spent years looking for an ex RFDS Jolly green giant. A garage full of old Codan stuff and I have never seen him power one up. I can't understand collectors. To me, they are one of life's little mysteries :))
I remember when the head of Charleville RFDS was "promoted" to Cloncurry. It was seen as a peak position. Charleville is still there, and is much better known by many. Cloncurry is now a base for 737 rather than the RFDS.
Todays rooster is tomorrows feather duster I guess.

Michele,

I don't know, but it's possible, I guess.
I also believe that when I lived overseas (was G0XBQ - last G0
issued!, then portable in Chile and the USA) that the same
restrictions applied - could be wrong.

Another wry laugh was last week when I met a radio tech straight out
of TAFE, and he could not understand W=EI, as it's now P=VI, I
believe.....

One does show one's age - Chris

4029. 6924 - Looking for a Thick Film Hybrid Microphone Amp 23-30001 AKA Rocking Horse doo's

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-12-20 09:47:15 UTC
From: David Wilkins
Topic: 4029 Message: 4029

Hi Guys
I get a daily digest but haven't really participated till now.

I have just recrystalled my 6924 Mk2-S for several channels in the 80 m amateur band as well as retaining 5680 and a few other channels for LandSAR ops.

I lost the plot in the final stages and managed to connect one side of the balanced microphone input to ground which instantly nuked the microphone amp. Too bad I blew up the amp before I connected the test circuit with the isolating transformer fitted and then spent a bit of time thinking I had made some other error before I traced the lack of audio drive.

Anyway does anyone have an old 6924 IF and Audio board or a spare microphone amp hybrid circuit part 23-30001?

Failing that does anyone have a whole 6924 that I can scavenge or otherwise use to recover one working unit?

The alternative would be to build a new amp from a couple of Op Amps so does anyone have an already proven circuit for a balanced input amp that would do the same job or have all old 6924's simply been trashed when the hybrids go down?

I quite like the old 6924. Whilst it isn't super portable it beats a synthesised rig by miles in the current draw department and the mute is excellent. My miniature Yaesu FT-817 draws about 300 mA on idle and it only has 5 Watts max output. As for the larger rigs their idle current exceeds even that of the FT-817 in transmit. So if possible I would like to get the old machine going again.

Any suggestions, other than toss in the sea, gratefully accepted.

Regards
Dave Wilkins ZL1MR

Topic: 3990 Message: 4030

Rich, Jim! That's rich! Well from memory the " ex RFDS Jolly green giant" cost around $75.00 and the ex DOTA VHF AM tranciever was $50.00 as niether of them happened to be in standard 19" racks, so of no interest to the second hand mob. Both bought at auction and it took 10 of us to
load and unload the RFDS unit from the back of a Land Rover forward control 109 belonging to a friend who offered to transport it.
My brother beat out a certain VK2*** on the bidding for the RFDS unit. Otherwise he may have started re-transmitting broadcasts on the AM broadcast band as well as simulcast on 27 mhz cb and UHF cb.

Sam

Jim wrote:

>Wow Sam, you were rich :)) All that gear. *sigh* . I actually have the 100w TS130 here in storage for my brother who's o/s in the UK. Nice little rig thats dated but still going strong. And I know a collector that has spent years looking for an ex RFDS Jolly green giant. A garage full of old Codan stuff and I have never seen him power one up. I can't understand collectors. To me, they are one of life's little mysteries :))
>I remember when the head of Charleville RFDS was "promoted" to Cloncurry. It was seen as a peak position. Charleville is still there, and is much better known by many. Cloncurry is now a base for 737 rather than the RFDS.

Hi Guys

Old military radios! What about the Number 19 sets and the number 62 sets? A few of us had these when we were in our mid teens in Adelaide.
Some where legal some were not.
There was a big blitz and crackdown in about 1962-63 after a couple of schoolboys were caught transmitting illegally and upsetting the school cadets with their A510 sets.
The Sh** hit the fan when the inspectors thought that they had collared the lads, only to find themselves on the receiving end of a 3/8 inch ball bearings propelled from shangeyes, and side cutters to take care of the tyre valves.
The boys left the batteries and dipole but got away with the radio equipment. They were never tracked down and were never heard on air again. The story goes that they sold the radio 2 months later.
By the way does anyone know where any AN/PRC 77 sets can be obtained. I have heard that the Army has started to dispose of them.
There is a couple of guys restoring some old military vehicles and would like to get 3 sets to fit to the 125 equipment in the vehicles

Regards

Jeff

PS. No! I was not one of the pirates.

David, haven't found it yet but I was sure that I had a board here. Not sure of its status but audio should be ok. All I have to do is find it and that may take a while :)
Yes the old lunchbox is a marvel. I've done a lot of them and am still doing up my personal one. I still have to make it effecient over 10 meg to squeeze the upper 737 frequencies in. The mute board works so well that it really needs something to remind you that the radio is still on. I'm playing with a mic beep circuit at the moment, handy with low power and network operation.
I presume that on 80 you actually use lsb by tuning the chan coils appropriately ?
Some 6924 details can be found here http://home.iprimus.com.au/jimshire/6924.htm

Cheers
Jim

Hi Thanks,
My error, you want to change a 2 wire to a 4 wire. Not as easy as you may think. Needs a new board fitted to both the 8570 and 8571. They are over $500.00 AUD each. I ran a twisted pair instead.

As I recall 2 wire leased line for remote TX operation used a phantom circuit for PTT and renote on/off mute ect.

to convert 2 wire phamtom to 4 wire phantom, just use a hybrid with DC loop bypass.

If going over a radio link or mux equipment a 4 wire E&M circuit is normally used, then a signalling converter is needed, assuming the 2 wire mode uses phantom DC signalling.

I recall the 2 wire leased line needed DC conductunity between remote and base. (had to be a physical bit of copper between point a&b)

As a trainee liked going across a 2 wire radio line with a buttinski and loop the line saying gday there and got a reply, or the time went across a radio programme line and listened in and cut it off hehehe

Wayne,

A simple RFDS 2 tone signal may be used with a DTMF telephone dialing chip sending digit 4 (770hz 1209hz, 439 hz difference freq), the way the RFDS 2 tone decoding works it receives the 2 tones in the audio passband and if the difference freq is with in the 440hz window a valid signal is detected.

Yep your right Paul,

Where i work in a TAC (technical assisatance center) we get phone
calls from dealer techs, who ask its dead what do i do, ummm how do i
plug in the pc and run hyperterm, ummm what part number board to
swap, i left the laptop in the car, oh i left the multimeter in the
car, ect ect ect.

The trend nowdays is to have basic under trained techs, to attend site
(within the agreed responce time) and pretend they know what to do,
and call the TAC to figure out what to do.

The day of a real tech with core training, how to think, self starter
is over.

Regards

Yep. When I started at Trades school at RMIT in 1990 (yep, a spring chicken & one of the last!) a teacher told us that in 15 years time Comms Techs would be so few and far between we'd be able to name our own price.

Well he was half right, they are rare as hen's teeth - the local comms business here can't get another one.

But I get paid more as an Ambo.

Dave

Hi Dave,
If you do toss it let me know.
I will be seeing an hf tech in Sydney tomorrow & I will ask if he has any for you as I know he works on the MK2S marine version. I do not know what the cost would be if he has. I have just had my Mk2 rechannelled & will be fitting a Janel selcall mike to it as soon as the mike arrives.
I think they are great sets.

Can you remove the covering on the thick film & repair same? I had some luck doing this on thick films in TV's some time back. Good luck as I must return to fixing my autotune now.

Cheers
Wayne

Hi All,

Im after a idea to use a old terlin tapped whip (1.8mts length), scrap old windings and to design a tapped helical antenna, within a freq range of 3.550 to 15.00 Mhz with the min numbers of taps and a max swr of 2.5:1 across the freq band.

Would it be possible to say have 12-15 taps across the lengh.

I recon the maths behind a tapered diamater whip and a tapered wound wire pitch for best radiation effiency and tappings for a max swr would be a very complex calculation.

Has the wheel already been invented or im asking the question 1st time here.

Any ideaś,tips or internet links would be great.

Thanks in advance

Frank

Hi All,

Im after a idea to use a old terlin tapped whip (1.8mts length), scrap old windings and to design a tapped helical antenna, within a freq range of 3.550 to 15.00 Mhz with the min numbers of taps and a max swr of 2.5:1 across the freq band.

Would it be possible to say have 12-15 taps across the lengh.

I recon the maths behind a tapered diamater whip and a tapered wound wire pitch for best radiation effiency and tappings for a max swr would be a very complex calculation.

Has the wheel already been invented or im asking the question 1st time here.

Any ideaś,tips or internet links would be great.

Thanks in advance

Frank

The 2 wire 8570 etc. we are using over a leased line has no DC
continuity as it travels on Fibre optic for 2 legs. It uses a tone for
TX and passes data as well (RX Audio is muted when data is passed as
well as a "Heartbeat" beep sent from Console to remote.

Hi Sam,
I don't want to complain but I'm going to. You have combined my email and Franks together. No where in my email did I make the comments lower down. The first 2 sections are mine and the rest are Franks. That's why I asked the question "are you getting an older model of linking gear mixed up with the 8570/71" when he made the comments further down
Regards,

Malcolm Langley.

Using inband signalling makes it very easy then, as all control
signalling is with in 300-3000Hz audio range it can go over any type
of voice link even a dial up connection, radio, physical, derived ect.

To convert use a pair of hybrids between the 2wire control units and
the 4 wire circuit or as its only a half duplex speech contol(PTT
control at each end of radio), all really need to do is to use a
resitive combiner between the 4 wire side and 2 wire site even as
simutainious audio full duplex on 4 wire side is not used a hybrid may
not be needed.

Regards

Please accept with no obligation, implied or implicit, my best wishes for an environmentally conscious, socially responsible, low stress, non-addictive, gender neutral, celebration of the summer solstice holiday, practiced within the most enjoyable traditions of the religious persuasion of your choice, or secular practices of your choice, with respect for the religious/secular persuasions and/or traditions of others, or their choice not to practice religious or secular traditions at all.

I also wish you a fiscally successful, personally fulfilling, and medically uncomplicated recognition of the onset of the generally accepted calendar year 2005, but not without due respect for the calendars of choice of other cultures whose contributions to society have helped make Australia great (not to imply that Australia is necessarily greater than any other country), and without regard to the race, creed, colour, age, physical ability, religious faith, or sexual preference of the wishee.

By accepting this greeting, you are accepting these terms:

a. This greeting is subject to clarification or withdrawal.

b. It is freely transferable with no alteration to the original greeting.

c. It implies no promise by the wisher to actually implement any of the wishes for her/himself or others, and is void where prohibited by law, and is revocable at the sole discretion of the wisher.

d. This wish is warranted to perform as expected within the usual application of good tidings for a period of one year, or until the issuance of a subsequent holiday greeting, whichever comes first, and warranty is limited to replacement of this wish or issuance of a new wish at the sole discretion of the wisher.

Cheers - Chris

Thank you for your greetings Chris, you've obviously passed PC 101 :))
Having sent one of my brothers the traditional greetings, I remembered that his new wife doesn't celebrate Xmas for religious reasons (!), so I sent him a copy of your greetings. That should do the trick.
I must say that one of the wonderful things about ham radio at this time of the year used to be receiving Christmas greetings from people of many beliefs and persuations in many lands. I sincerely hope that this tradition hasn't had the kybosh put on it.
At this time of the year my thoughts are also with those who are in less than cheerful circumstances, whoever and wherever they may be.

Cheers
Jim

Sorry Malcolm, must be Christmas cheer slipping down eh in to my
fingers. Replied with the wrong original email, sorry.

Been busy here today so far, sent to 2 MVA's one car versus tree 30 k
away (Not in our area but unit from that area unavailable.)
and one just as we finished a roast Turkey Christmas eve dinner which
was a motorcycle versus ute at 100 kmh just down the road.
Oh yes and in between was a bush fire to respond to up on the range. And
the first MVA was also when I was still at my normal work.
Not a good start to the Christmas / New Year period here. At least no
deaths so far.

Again, Sorry about that Malcolm.

Sam

Hi Sam,

I thought you were another ambo for a minute, until the bit about the fire.

You can keep your fire and I'll keep the prangs.

I'm on shift at 1500,

Merry Christmas

Dave

Typical HF 100W SSB finals are MRF102 used in Codan, Tracker, PCM and
other HF SSB radios, they normally sold as a matched pair with same
gain bias current ect (a matched pair has the same colour dot on
them) im sure the new cost is $$$ over $100+ for the pair, your best
bet is to scrounge a radio and garner the PA board or recover the
transistors.
What Codan Radio model is it??

Regards

4064. 8558 spring

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-12-29 10:19:23 UTC
From: Steve Stewart
Topic: 4062 Message: 4064

Hi team,

My aerial sometimes does not tune - someone mentioned that the spring on the top of the aerial could be the cause.

Apparently there are two types of spring, a curved spring and a straight sided spring ? the curve one is supposedly the one with the issue and the straight one is ok

Steve
